Wrenches, Ratchet and Basin.
Bemis & Call Hardware & Tool Co., Springfield, Mass.

Don't Be a Commercial Explorer

¶ You haven't time to go exploring round on your own account discovering who's who in machinery and supplies.

¶ Time is too valuable these days.

¶ If you want to buy a machine or piece of equipment the easiest way is to consult this Directory.

¶ *The firms represented here are modern, reliable,* and their prices are right, and *they are already on the map.*

Use this modern guide to good buying.

The advertiser would like to know where you saw his advertisement—tell him.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

Air Compressors.
A. R. Williams Machy. Co., Toronto.

The "No-Wear" Nozzle

An exclusive feature of the "Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

"BUTTERFIELD"

Taps, Dies, Reamers and Screw Plates

We Guarantee Our Tools To Be Efficient And Economical

We welcome comparative lists because we know that our tools will prove their superiority. **"Butterfield"** Tools **must** be absolutely **accurate** before they leave our plant.

Give them a trial—they'll save you money in every day of service.

BUTTERFIELD & CO.

ROCK ISLAND, QUE. DERBY LINE, VT.

"W&B" Reamers Are Ready for Those Getting Less than the Best Reamer Service

Wouldn't a reamer that will hold to size on two or three more jobs, than other reamers, interest you? "W & B" Reamers are made from highest grade steels, properly designed and tempered to give longest life and absolute accuracy.

Take the best reamer in your shop and put it to the service-test with a "W & B" Reamer. Note the quality of work done by each reamer.

When the test is complete buy the grade of reamers that show up the best. This is the kind of proof that sells "W & B" Reamers.

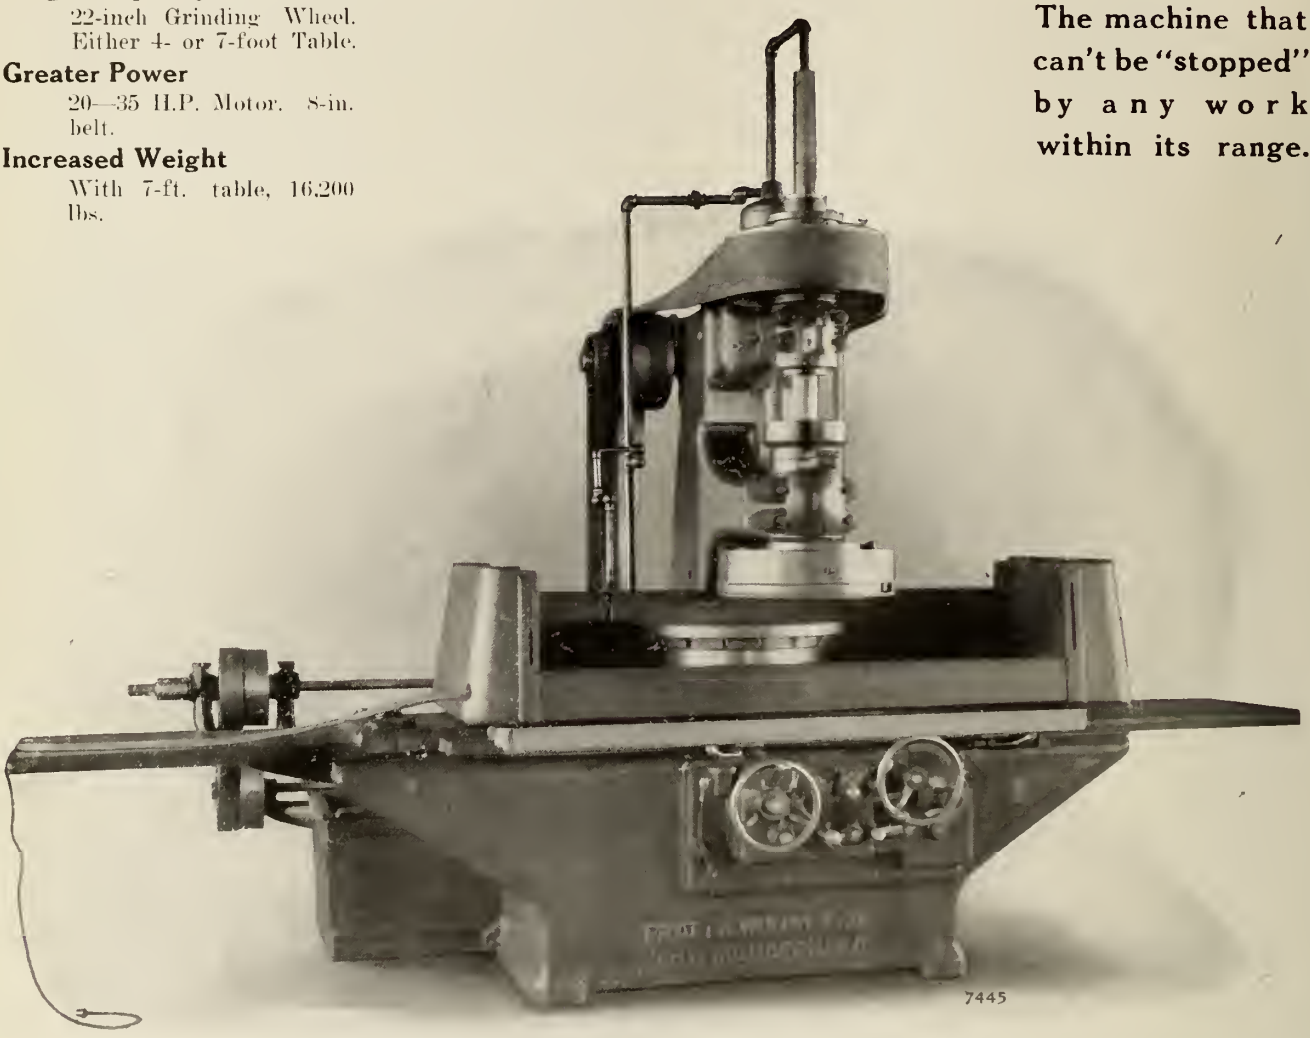
BUILDERS OF MACHINE TOOLS AND WOODWORKING MACHINERY



A New, Larger Model P. & W. Vertical Surface Grinder

Larger Capacity
22-inch Grinding Wheel. Either 4- or 7-foot Table.

Greater Power
20—35 H.P. Motor. 8-in. belt.

Increased Weight
With 7-ft. table, 16,200 lbs.

The machine that can't be "stopped" by any work within its range.

P. & W. 22-inch Vertical Surface Grinder

Massive Construction

Special attention is called to the unusual proportions and massive design of this new surface grinder. The machine has been designed with the idea in view that it must have unquestioned stability, an abundance of power and must retain its accuracy under the most severe service.

Ball Bearings

The spindle and driving pulley are provided with ball bearings throughout. Loss through friction is thus reduced to a minimum and practically the entire power is utilized for driving the wheel.

Power Traverse for Table

In addition to two power feeds, the table is provided with power quick-return motion for use in connection with rotary chucks.

Flexible Work-Holding Devices

The various work-holding appliances are very flexible and will accommodate a wide range of work. The machine may be furnished with rectangular reciprocating, and single, double and quadruple rotary chucks of either plain or magnetic type.

Have you a Chilled Iron Grinding Problem?

Then you will be interested in the following reports of the grinding ability of

NORTON GRINDING WHEELS

A Crystolon wheel ground (dry) the treads of 44 chilled iron truck wheels while the best previous record was 32 wheels ground. The Crystolon wheel lasted one-third longer, cut as fast and required no more dressing than the wheel previously used.

A Crystolon wheel used to snag sharp fins from the hubs of chilled gray iron wheels used on wagons, trucks, etc., "cut faster than the wheels formerly used and required hardly any dressing." A similar report comes from a manufacturer of metallic bedsteads.

Canadian Agents: The A. R. WILLIAMS MACHINERY CO., Toronto, Montreal, Winnipeg.

When a B & K pipe machine is installed where other pipe machines are already in service, you will find all the men will want to run it. They can cut-off, ream and thread pipe with the assurance that when the piece is removed from the machine that it will be a good job.

Our machines are designed and built for permanent, high-economy service. The explanation lies in their heavy construction, large bearings and careful fitting. What good is the powerful drive on a pipe machine, if the gripping chucks will not hold pipe?

Sheet Metal Working Machinery, Tinsmith Tools, Canning Machinery, etc.

Starrett Hack Saws

It is as useless to expect good service from a hack saw made for cutting cast-iron, but used on brass tubing, as it is to expect a good yard-stick to replace a micrometer for fine measuring. You have got to suit the tools to the work.

That's where the Starrett line of hack saws fits strong—because there's a Starrett for every job. No matter what the work—cutting steel shafting, tubing, pipe or casting, there is a Starrett just suited to that kind of cutting and it will cut quicker and last longer than any other saw.

Every Starrett is made of the finest tungsten steel, which gives great hardness without brittleness. The teeth are **milled** evenly and set perfectly so that each tooth does its proper share of the work. Starrett hack saws are made in suitable lengths and sizes for all hand and power cutting.

Starrett Tools and Hack Saws are sold at all good hardware stores.

Send for our big, new, free catalog No. 203. See our styles and prices and learn how you can save on your hack saw costs.

Milwaukee Millers

The Double Over-Arm

There are two significant facts about the double over-arm:—

First:—The comment of nearly every manufacturer and mechanic has been, "Why didn't somebody think of that before?" Its desirability and advantages are quickly appreciated.

Second:—Because of the strength and rigidity of the remainder of the machine, the capacity of a double over-arm Milwaukee Miller is limited only by the ability of the cutter to take the cut. The cutter, not the machine, is the limiting factor in figuring how fast or deep a cut may be taken.

This is but one of the many excellent—and *exclusive*—features of Milwaukee Millers. The full facts are given in our Bulletin.

NICHOLSON MADE

FIRST—

Get the NICHOLSON-Made File That Best Suits Your Work.

THEN—

Use More of Them.

A dozen wrong-type files won't give you half the satisfaction of a single file that's right for your use.

When you specify NICHOLSON-MADE FILES, you simply can't go wrong.

Over 4,000 distinct patterns and sizes make it an easy matter to get the RIGHT file for your work.

And a NICHOLSON-MADE FILE represents the highest possible efficiency for its type.

Made from the RIGHT grade of steel—
Cut on our own special-built machines—
Inspected and tested after every important operation—
Embodying the results of 50 years in making great files,

each NICHOLSON-MADE FILE is a tool of matchless efficiency and economy in its particular field.

To get MAXIMUM File Service, use NICHOLSON-MADE FILES. To get the MAXIMUM service from NICHOLSON-MADE FILES, discard them as soon as they become half-worn.

The extra expenditure of 15c for a new file generally means a $1.50 saving in labor and time.

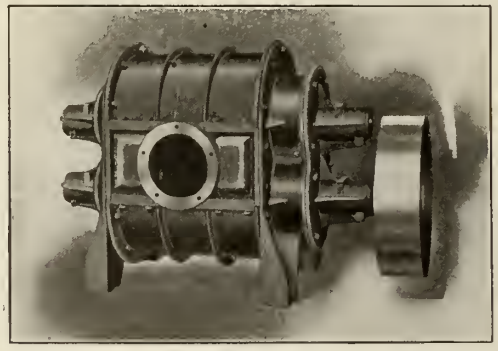
"FILE FILOSOPHY"—A 50 years' education on files in an hour, and our Catalog, sent FREE on request.

The greatest features about the Williams Pipe, Nipple and Belt Cutting Machines are the quality and quantity of work they are capable of turning out, durability, easy operating and moderate price.



The machine is the result of years of experience, and its superior merit is being demonstrated daily in 1,500 progressive and up-to-date shops.

If you are interested in a machine that will make you the most money and represent the best value to be had, drop us a line, stating capacity of machine wanted.

SHERBROOKE, QUE.

BLOWER DEPT.

Burnish in thousands together, the things you now polish singly—

those small parts — steel, nickel, brass, aluminum—so hard to hold while polishing, so hard to clean when polished.

Put them all into an

Abbott Burnishing Barrel

together with some soapy water and some Abbott carbonized steel burnishing balls.

When you take them out a few hours later they'll be burnished brighter than your most experienced operator could polish them. And the cost—15 minutes of a laborer's time, a few cents worth of soap, and the Abbott balls, which don't require renewing, which wear indefinitely.

Can you do it as cheaply as this now?

Hadn't you better send for full particulars?

The Abbott Ball Company

The Force That is Moulding A World

The man who can move a product, the man who can move an idea or a thing from where it was made to where it is used and bring back something of value in exchange, is the Force that is now moulding and making the world of which each of us is a part.

No man is paid to sit at a desk, nor to fill a chair,—except College Professors. We are paid to deliver a thing from "here to there" and bring back something in return. The problem of civilization, the problem of each firm and of each business man is to set each man and woman at work doing that which he can do best.

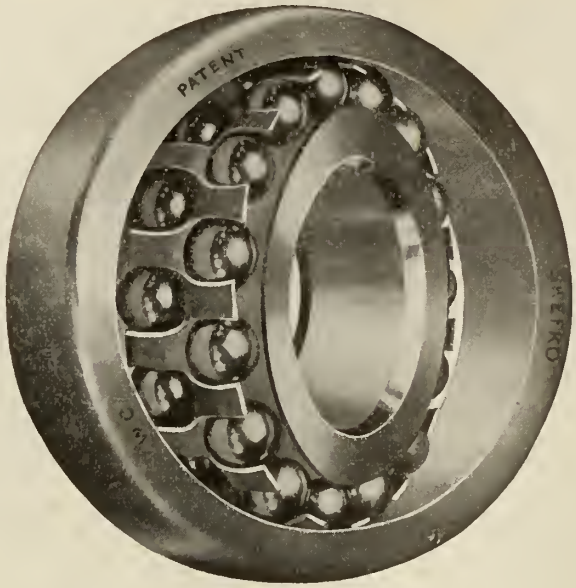
Each of us should be a producer, should be at work where we can show results. We are paid, or should be—and some of us are—for our ability to produce. Land is worth what it will grow when intelligently cultivated. Real estate is worth what it will bring because of accessibility and location. What will it bring? What can he produce? This is the principle that underlies it all.

The man who uses other men to help and to lend a hand in the great scheme of usefulness, is the man that gives opportunity. And opportunity means life and liberty and love and success and health and happiness. And these are the only things that are really worth while.

Each of us is paid for doing something that needs to be done, but too many of us are able to do nothing that anyone wants done. Too many of us have no trade, no skill, no training. There is nothing we can make or sell or buy, and consequently we possess no desire to perform useful service because we do not understand what service means.

Our present methods of training young men and young women during the early and all important years of life is wrong, and worse it is travesty and more than this: it is a crime against the race and against the individual who suffers. We grow up to manhood and womanhood without a trade, without an occupation, without anything the world can use in moving something from "here to there" and bringing back something of value in exchange.

The man, the woman, the boy or the girl that must earn a living should be trained to do something well—skillfully—for these are the things that count in moulding and making an individual that improves the standard of things about him.



To those who are toiling in the mines, inventing machinery, weaving the cloth that clothes the world,—to those who are driving our engines of power and guiding our trains across the continent,—to those who are working in our offices of business—to those who are breeding better plants and growing flowers to feed our souls with beauty—to those who are spanning our streams with structures of steel—to those who are training their hands and minds to do something useful here in the great scheme of building a race of men and women —my heart goes out to them across the miles.

For all these we need finer homes, better foods, finer clothes, better books, cleaner newspapers, better shops, safer travel, more parks and more play-grounds for recreation and change, and when we begin to teach our children to do the thing they are best fitted to do so that they will be able to render a service the world is willing to pay for,—then, and not until then, will we have all of these things.

The problem of civilization is to set men and women at work doing that which they can do best; for the individual of this type sets a higher standard for everything touched by his money and his intelligence.

Efficiency

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Development of Chain Gearing for Power Transmission--I*

By H. T. Hildage

Chain gearing as a possible solution of the problem of furnishing an improved means of transmitting power to machines in factories and workshops is dealt with in the accompanying article, while a resume is also given of the progress made in design, manufacture and application as exemplified in modern installations.

IT is obvious that transmission combining the positiveness of spur or helical gearing with the flexibility of belt or rope driving would be likely to attain more nearly the theoretical efficiency of either, and by virtue of this fact and its general adaptability would be very nearly an ideal transmission for the numerous and comparatively small drives in factories and workshops. The ideal transmission may be defined as the one having the following characteristics:

Positiveness.—There must be no possibility of slipping or flinching either under the ordinary running load, under ordinary impulses, or under temporary overloads of considerable magnitude.

High efficiency.

Flexibility.

Absence of narrow or rigid limitations as regards distance between shafts.

Durability.

Quietness of running, and freedom from vibration.

Low cost, both for installation or maintenance.

Elasticity of Ratio.—It should be of such a character that in any specified case it will be possible to obtain readily changes in the speed ratio.

Chain-gearing Claims.

Having thus indicated the pressing need for an improved method of transmitting power to machines in factories and workshops, and the qualities that would be required, we may proceed to consider chain-gearing as a possible solution of this problem, to examine how far it will fulfil the requirements, and to see what progress has been made in the development of its design, manufacture and application. Taking the requirements in order, and, with reference to the positive drive feature, it is obvious that chain-gearing is a positive transmission.

Efficiency.

The calculated efficiency of a chain drive under the worst circumstances of size of wheels and ratio is over 99 per cent., and the calculation takes account of all losses that are of serious consequence, but does not take account of any friction in the bearings of the shafts that are being connected, not even that portion of the friction due to the driving pull. The difference between perfect and commercial conditions for chain-gearing is not such as to detract seriously from its efficiency. A number of experiments made for the purpose of measuring the efficiency of chain drives have shown it to be between 96 and 98½ per cent., and in these cases the losses include not only those due to the chain itself, but also those due to such part of the resistance in the ball bearings of the motor and generator as were induced by the driving pull on the chain. If a chain drive receives ordinary care and reasonable lubrication during its life, its high efficiency is maintained until the chain is completely worn out. In the case of ropes and belts, the result of neglect is a mere falling off in efficiency, which, while costly, is imperceptible. With chain-gearing as with any other mechanical contrivance, negligence is rapidly destructive, and immediately attracts attention.

Flexibility.

Chains are, of course, quite as flexible as belts or ropes, and their flexibility does not depend upon any bending of material. The bending takes place about a properly-prepared bearing which is specially designed to reduce friction and keep wear at a minimum.

Shaft Centres Limitations.

There are limitations of the distance between the centres of shafts to be connected, but they cannot be said to be either narrow or rigid. The minimum centre distance for a chain drive is the sum of the radii of the smallest wheels that can be put on the shafts to give the required ratio of reduction, and this, in general, does not exceed the centre distance for a corresponding spur wheel drive. The maximum centre distance, which to some extent depends upon the inclination or "lie" of the drive, is about 20 ft. Small variations in the centre distance are of no consequence—that is, the efficiency and satisfactory working of the drive no more depend upon the distance between the shafts being an exact figure than in the case of ropes of belts.

Durability and Quietness.

The fulfilling of the first condition depends upon the excellence of design and the quality of workmanship and material used in the manufacture of chains and wheels, and the discussion of the design and application that follows will make it evident that chain drives are usually quiet, free from vibration, and sufficiently durable to be reliable. and economical.

Low Cost.

In first cost, the mere substitution of a chain for a belt or rope, without any other change in the conditions, would not, as a rule, be economical. In all probability a chain drive would often cost more than a spur wheel drive for which it was substituted, but if it were possible to remodel the conditions of a rope or belt drive, so as to make them suitable for chain-gearing, the total cost of the installation would usually be less with chain-gearing than with belts or ropes, because shorter centre distances will be used, larger ratios will be possible, and other modifications and economies in design and arrangement will be made.

Again, if cost be defined as the total cost, including first cost, maintenance, depreciation, interest, and power absorbed in transmission, it is comparatively easy to demonstrate that chain-gearing is much cheaper, where it is applicable, than non-positive drives.

Elasticity of Speed Ratio.

In the present state of its development, chain gearing will not readily fulfil this requirement. There is, however, a possibility of its doing so in the near future.

Chain Requirements.

Bearing in mind the importance of efficiency, durability, quietness in running, and freedom from vibration, the requirements of a satisfactory chain can be stated as follows:—

It must be so formed as to be capable of gearing with suitable wheel teeth in such a way that it will enter and leave the wheel without great loss of power, and without noise.

The joints must be so designed and made as to be capable of resisting wear for a long period of time.

Wheel Requirements.

The requirements of satisfactory wheels are:—

That the tooth form shall be such that a suitable form of chain link will gear with it, with as little impact as possible and without friction, will remain in gear, and will leave freely and without friction. Small increases in pitch of the chain, due to inevitable wear, must not detract from the satisfactory fulfilment of the first condition. There are two principal solutions of these requirements—the so-called silent and bush roller chains.

*From a paper read recently before the Manchester Association of Engineers.

Silent Chain.

The silent chain, patented by Mr. Hans Renold in 1895, which runs on the face of its wheel after the manner of a belt, consists of a series of flat plates with working faces formed upon them, and fitted with bushes or bearings of some type or other, and strung together upon a stud. The angle between the working faces is usually 60 degs., and these working faces engage with the tooth form of the wheel, which is a plane surface. From a study of the action of the chain on entering and leaving the wheel, the only impact, that on entering, is produced by the angular movement of the link about one of its pivots. There is no sliding on the tooth faces, therefore, the silent chain when new is an almost perfect solution of the problem.

The working face of the chain when it has become extended in pitch engages with the working faces of the wheel teeth at a higher level—that is, on a larger pitch circle, and consequently between the position of the chain when it is new and as deeply in engagement as possible, and its position when it is in danger of riding over the tops of the teeth, there is no change in the method of gearing, and consequently the efficiency is unaffected.

This is the consideration that fixes the limit to the useful life of the chain, and the aim of the designer must be, as far as the chain is concerned, to make the wear of the bearings proceed as slowly as possible until the limit of permissible extension, and consequently useful life, is reached, and, as far as the wheel is concerned, to make the depth of the teeth as great as possible, so that the permissible extension, and consequently the useful life, may be increased.

Link Form, Silent Chain.

The important features in the design of link form are the pitch, the angle between the working faces, and the radius of the tangency circle, or the distance from the centre of the pin to the working face.

The pitch or distance between the studs will depend upon the range of powers that the chain may be required to transmit, and upon the range of speeds that it will be required to operate at.

Silent chains of the same pitch are made in different widths. When the pitch of the chain that it is proposed to use is fixed by the speed at which it must operate, the required strength is obtained by varying the width of the chain or the number of links that are threaded upon the stud in each combination. It will be seen later, in considering the number of teeth in the wheels that, for higher speeds, smaller pitches must be used.

It should also be remembered that where exceptionally smooth turning is required, as, for example, the driving of some kinds of grinding machinery, it is necessary to use wheels with a large number of teeth, and this also means a shorter pitch. After all, a chain wheel is not a perfect circle, but a polygon having as many sides as the wheel has teeth.

The angle between the working faces mostly commonly used is 60 degs. Other angles, both larger and smaller, have been tried, but 60 degs. is found to give the most useful range of wheels; namely, from a minimum of 15 teeth to a maximum of 120 teeth. The explanation of this is as follows:—

The minimum number of teeth is fixed by the shape of the teeth, and by the impact of the link in coming into gear with the teeth. It is obvious that if a 60 degs. face angle is used, the flanks of a tooth in a pinion having 12 teeth will be parallel to each other and to the radius passing through the centre of the tooth. Fifteen teeth have been selected as the minimum, because on such a wheel the teeth, while not undercut, are sufficiently thicker at the root than at the top to satisfy the requirements of good design.

Experience shows, however, that it is inadvisable, if it can be avoided, to use even so few teeth as fifteen, especially at high speeds. It has been observed that silent chains running on such small wheels, at high speeds, wear out rather rapidly, and this is probably due to the fact that the impact between the links and the tooth faces at entering has a damaging effect on the bearings.

For these reasons, then, it is advisable that where the linear speed of the chain will exceed 1,000 ft. per minute, there should be not less than 17 teeth in the pinion, and 19 teeth will give a quieter drive and greater durability. This, of course, is assuming that the face angle is 60 degs. If the face angle be greater than 60 degs., a satisfactory tooth form, from a design point of view, can evidently be obtained on a pinion with a smaller number of teeth than fifteen, but the considerations of impact, above referred to, would preclude the use of pinions having a smaller number of teeth.

On the other hand, with a face angle of less than 60 degs. the minimum number of teeth in the pinion, from a design point of view, will be greater; but then another consideration comes into operation; namely, the maximum number of teeth that it is desirable to use in any drive. This maximum is fixed by considerations of an entirely different character, which will be dealt with presently, at 120 teeth. If, then, a more acute angle be used between the working faces of the link and the pinion thus obtained have a larger number of teeth, we shall probably obtain rather quieter running, but the magnitude of the speed ratio possible between the driver and driven shafts will be reduced.

With regard to the maximum number of teeth that can be used in the other wheel, it has already been stated that the life of the chain is limited by the difference between the radii of the pitch circles on which the chain runs, when it is new, and when it is just on the point of riding over the tops of the teeth. This difference depends, as far as conditions external to the chain are concerned, upon the depth of the teeth. The depth of the teeth, to all intents and purposes, is independent of the number of the teeth. The considerations that fix it will be indicated later, but the angle between corresponding faces of adjacent teeth depends only on the number of teeth in the wheel. In figures it is 360 degs. divided by the number of teeth.

It is found that with the depths of teeth generally used, a chain that has its pitch extended by 2 per cent. will just begin to ride over the tops of the teeth in running on a wheel having 120 teeth, and 2 per cent. extension of pitch is a convenient figure to fix upon, from the point of view of chain condition. It is, therefore, not desirable to use a wheel having more than 120 teeth under ordinary conditions.

Tangency Circle.

Each of the working faces of a link is at the same distance from the centre of the adjacent bearing—that is, they are tangential to two equal circles described about the bearing centres. Each pin or stud is common to the links of the two pitches that it connects, and, therefore, the corresponding tangency circle of these links coincide. It follows that the working faces of the connecting links are tangents of the same circle, and, as these working faces lie on adjacent wheel teeth, the latter are also equi-distant from the pin centres.

It will be obvious, then, that the effect of increasing the radius of the tangency circle will be to increase the size of the links, and reduce the size of the teeth. At the same time, as the size of the teeth is reduced it is necessary, for the sake of strength, to limit the height to which the chain can climb in adjusting itself for increase in pitch, and this, in turn, limits the life of the chain. On the other hand, a reduction in the radius of the tangency circle will affect the design of the pin, and a compromise is, therefore, necessary.

Assuming that in our link design the pitch, the angle between the working faces, and the radius of the tangency circle are fixed, it is possible to complete the shape of the link.

In the first place, the throat must be sufficiently high to clear the tops of the teeth under any condition that might occur. The depth of the throat will also have its own effect upon the elasticity of the chain. If it extends considerably higher than the line connecting the centres of the bearings, obviously the chain will be very elastic, and this property of elasticity is sometimes a valuable one, making for softness and smoothness of running, as well as silence and efficiency.

In the second place, the inner face of the link must be at such an angle that it can under no condition, either entering or leaving, come into contact with the teeth. It has been found by experiment that under reasonable conditions there will not be a backward bend of the chain, on entering or leaving the wheel, greater than 15 degs., so that the inner faces of the links can be designed with this in view.

That portion of the outer edge of the link contiguous to the working faces must be of such a curvature that with the same backward bending it also will clear the teeth—that is, it must fall entirely within the tangency circle. The back of the link must be decided in conjunction with the shape of the throat, because in certain circumstances it is this that will fix the strength of the link.

The Bearing Feature.

The bearings should be designed entirely from a durability point of view. It is obvious from the remarks that have been made on the subject of efficiency that the difference between the most efficient and the least efficient design of bearing, or, in other words, the design of bearing that gives the least and the most friction, is very small, amounting to something less than half of 1 per cent. of the power transmitted. The expression that this consideration has been given by different makers is shown in the different types of bearing that have been used, and a brief description of these will be of interest.

Plain Bearing.

In the first form of silent chain, the links were punched from steel strip, and hardened, and the studs were plain circular pins. This is the most obvious kind of bearing to use, and naturally efforts immediately began to be made to improve it. It is interesting to note, however, that some chain drives made with this type of bearing lasted as long as fifteen years, so that it must not be too readily assumed that it was a bad one.

Bushed Bearing.

The next type of bearing was what is known as the bush type. Glass hard steel bushes were forced into the links, each bush connecting two, or sometimes three, plates. The pin was a plain steel pin, case-hardened. This type is still used by one firm entirely, and by another for the smaller sizes of chains—that is, from 5/8-in. pitch downwards.

Multiple Block Chain.

The firm that originated the bush type of bearing found it very difficult to obtain the required degree of accuracy when two or more flat plates were strung together on the same bush, and it was not found possible at the time to punch the links from material heavy enough to make them from a single plate, and so another design was adopted. Steel bars were obtained, cold drawn, to the required section, and the chain was made up of blocks, sawn from these bars and case-hardened, the pins still being plain pins of mild steel, case-hardened.

In this design special attention was paid, for the first time, to lubrication in the bearings. Slots were cut in the links, giving access to the pin-holes from the inside, and oil grooves were turned on the pins. This type of chain is very expensive, but exceedingly durable. Some drives that were fitted as long as fifteen years ago are still running with the first chains, showing few signs of wear. Each of the above-mentioned designs were originated by the firm that obtained the first patent for silent chain gearing; namely, Hans Renold, Ltd., and made by them.

Training the College Man for Railroad Service*

By John S. Hall**

Despite the fact of its being abundantly apparent from the contents of the accompanying paper, that the author is an enthusiast in his chosen calling, there is no attempt made, except by appeal to reason, to show that College training, combined with an Apprenticeship System is accomplishing other than the ideal set by those responsible for putting the scheme into effect. The paper is timely and will do much towards popularizing professional railroading.

INVESTIGATION shows that there are a number of railroads on this continent and in the Old Country, who consider it sufficiently to their advantage to offer special courses of instruction in practical matters to certain of their present or prospective employees. These courses generally consist of a systematic training in the various branches of the service, with a view of developing the student along broad and comprehensive lines to fit him for responsible positions.

Southern Pacific Railroad.

In the United States, among the best examples so far is the course in railroading operation conducted by the Southern Pacific. It is open to any young man between the ages of twenty-one and thirty, but preference is given, when all other things are equal, first to college or technical school graduates in the employ of the company, second, to men with a common school education in the employ of the company; and third, to college or technical school graduates not in the employ of the company. It is also stated that the company is not under obligation to any of the students to place them in official positions upon completion of the course. The allotment of time and service is as follows:—

Accounting Department	4 months.
Master Mechanic's Office	6 months.
Maintenance of Way	9 months.
Road Service	5 months.
Stores Department	2 months.
Signal Engineer's Office	2 months.
Station Service	6 months.
Train Master	8 months.

This makes the length of the course three years and six months. A booklet is also placed in the hands of each man, outlining the particular points he should observe during the different periods, together with a carefully drawn-up list of reading and references.

Great Central Railroad (Eng.).

In England, the Great Central has a plan very similar to that of the Southern Pacific. They allow, however, only a certain number of their high-grade clerks who display marked intelligence and ability to take advantage of its privileges.

Three years and six months is also the time divided among the various departments, as shown:—

Engineering Department	6 months.
General Manager's Office	6 months.
Goods Department	6 months.
Locomotive Department	6 months.
Marine Department	6 months.
Rolling Stock Department	3 months.
Stores Department	3 months.
Traffic Department	6 months.

Upon each change every student makes out a report of the experience he has just gained, the best of which are published, with comments by the general manager.

*From a paper read on February 10 before the Canadian Railway Club, Montreal.

**Student in the Department of Railways, McGill University, Montreal.

Canadian Pacific Railroad.

Here in Canada, the C.P.R. has a special apprenticeship course for transportation. Students spend two years and nine months, of which the first three periods of three months each are put in during the three summer vacations, leaving but two years for apprentice work after graduation. They divide the time as outlined below:—

Vacation.

1st Year—Shops ..... 3 months.
2nd Year—Roundhouse..... 3 months.
3rd Year—Road Service..... 3 months.

After Graduation.

Station Service ..... 3 months.
Stores Department ..... 3 months.
Master Mechanic's Office.... 3 months.
Track Work ..... 6 months.
Accounting Department .... 3 months.
Train Master ..... 6 months.

Special report forms are filled out for each period, and the whole carefully kept on another special record form by the official in charge of the students in the general manager's office. The foregoing covers mainly what has been done, so far, in the matter of apprenticeship in departments other than the mechanical.

The Apprenticeship Question.

Turning to the motive power department, an examination of the Convention reports of the Master Mechanics' Association and of the proceedings of various railway clubs discloses a great deal of divergent opinion on this much vexed question of apprenticeship. As far back as 1896 the college student as a special apprentice has variously engaged the attention of the master mechanics. We find that as an apprentice of the mechanical department he has come in for a lot of adverse criticism, mingled, sometimes, with a certain amount of praise.

The principal charge most people had against him was that he did not have enough practical experience. Others said he thought he knew too much; that he was on personal supposition intellectually much above those who were around him. It was also claimed that he did not have a sufficiently intimate knowledge of the men in the ranks. Our good friend, Colonel Lacey Johnson, in a discussion at the 1904 convention, struck perhaps a far truer note when he said: "We expect too much from the special apprentice, and he expects too much from us." Again, in 1905, when Mr. G. M. Basford, then editor of the "American Engineer and Railroad Journal," in a paper entitled "The Technical Education of Railway Employees — the Men of the Future," before the Convention, stated that special training is fundamentally wrong, but said later on that it probably would be necessary to continue the system of special apprentices for a time.

Leaving the Master Mechanics' proceedings, let us have a look at the report of the December, 1902, meeting of the North-West Railway Club. They were talking of what a special apprentice should do, how long he should do it, and what he should get for doing it, when one man from the Chicago and Great Western who started life—so he said—in the early eighties at five cents per hour, arose and said he envied the high wage they were talking of giving to the special apprentice—it was about eight or nine cents an hour. In other words, the unfortunate apprentice was accused of being overpaid. On the other hand, we have Mr. L. H. Turner, who was superintendent of motive power of the Pittsburgh and Lake Erie Railroad, at the time he spoke before the Pittsburgh Club in May, 1909, reported as saying that the special apprenticeship has not gone far enough.

Taking up the February, 1904, number of the "American Engineer and Railroad Journal," we see there that Mr. R. D. Smith, who was superintendent of motive power of one of the New England lines, said the man who has risen from the ranks understands his men better, and that the special apprentice is favored to the detriment of the rest of the shop; while someone else wanted to know why a college man should not be as competent as a roundhouse foreman; and a third ventured the remark that one reason why college men left the railroads was that they could get quicker advancement elsewhere.

Turning to the July, 1913, issue of the same periodical—now known as "The Mechanical Edition of the Railway Age Gazette"—we have Mr. Basford, in an address before the Casino Technical Night School in East Pittsburgh, reported as saying that it is possible to get a degree at college without thinking, and that most students do not know what they want, and most professors equally do not know what to give them. Again, in the October number, we find the question: "Why Don't Railroads Hold the College Man?" and a very good answer to the effect that the apprenticeship courses are generally too long and the pay too low. This man suggested the remedy of a two-year course with adequate pay.

Mr. D. C. Buell, in the November issue of the above-mentioned magazine, supports Mr. Basford's remark in that the majority of college men do not know what they want, and also adds that most of the college men he has handled do not know much about primary railroading, but he has observed that when a college man knows what he wants he can generally get it on a railroad.

Looking over our extracts and quotations collectively, we observe one thing clearly, which is, that the subject has mainly been discussed by mechanical department officials. The question now arises: May we not equally well apply these criticisms to apprenticeship in departments other than the mechanical? It is not impossible to think that the same remarks or suggestions cannot be applied to all. Are not the failings and the faults the same in principle?

Special Training Proving Its Worth.

Mr. Basford has given us to understand that he considers specially-privileged training fundamentally wrong, but when we see three large and representative railway systems building up and encouraging such special training, we feel that there must, at least, be a little good in it. No railway—or other kind of a business, for that matter—is going to do a lot of work and spend a lot of money without expecting a fair return on their investment. Take the special case of the Canadian course. You all probably know that it was the result of a great deal of labor upon the part of some of the most prominent railway men in the country, and they would not have been anxious to devote their valuable time to it unless they saw something ahead. The same thing can be said, too, of the other systems enumerated before. Again, when he says that most college professors do not know what to give their students, we refute that remark by pointing to the teaching staff of the Department of Railways at McGill. Every railroad subject is handled by a practical railway man.

Practical Experience Feature.

One of the dominant notes which has been sustained so far is "Practical Experience." We hear one man saying that he can learn all there is to learn in a shop in two years, while a recent writer in the "Railroad Age Gazette" considers it the height of egotism for any man—be he who he may—to make an assertion like that. We feel like telling a little story here.

A man, who is now a well-known university professor, was once looking for a job. His friends had told him he was a fine workman, and could probably handle a file with anybody. So he called in on the manager of a tap and die shop one day and made request for a position as foreman. He said he was a pretty fair machinist and produced a tap—quite like those made in the shop—to prove it. The manager said: "Young fellow, it matters very little to me whether you can personally do the work or not, but what I want to know is this: Can you make one thousand men perform that operation to our advantage?"

Now the writer appreciates fully the

fact that it would be pretty hard to tell a man to do something unless, beforehand, he had had some sort of an idea himself. He knows, however, the longer he stayed on a job the more he learned, and he also knows that he could go back to the shop or the roundhouse now, and learn more in three weeks than he did at first in three months; therefore, the vexing question of practical experience for special apprentices naturally turns on the query: "What is the right length of time to put in?" The Canadian Pacific-McGill University answer is "two years after graduation."

Long Apprenticeship Undesirable.

One cannot overlook, in this connection, that exacting too long an apprenticeship may defeat the object in view, since the engineering profession to-day offers too many temptations in the way of salaries to the graduates of technical colleges. Take a typical example:

A certain student has just graduated. He has busily applied himself for four long years in relieving his poor old father of the burden of superfluous cash. This fellow is just an ordinary human being, so he feels that it is about time he started to pay back a little of the money, or at least, to support himself. He hesitates to spend three or more years at a barely living wage, so naturally conditions have to be modified to meet this state of affairs, for unless there is sufficient inducement he will go elsewhere.

Along certain lines the remuneration offered to engineering graduates each year is surprisingly large, and this state of affairs has been realized here by the commendable reduction of the after-graduation apprenticeship to two years, as against the three and a half years' time required by other roads; also, by the fixing of a living minimum wage during the first divisions of the course.

Primary Railroading.

It has been seen before that Mr. D. C. Buell's opinion of the college man is that he does not know much about primary railroading. When a man starts out as a freshman, we agree to this statement. But what is "Primary Railroading?" Is a knowledge of it acquired by having the boss come around just as you are washing up early on a Saturday afternoon, in order to see the ball game, and tell you that one of the gaskets on the 1084 driving-brake cylinders is blown out, so that instead of eating peanuts and drinking pop, you spend the time till the night gang comes on, doubled up in a knot between the frames with a couple of sacks over your shoulders to keep the heat from warping your spine? Or would this knowledge be promoted by being called after two hours' rest to keep the 2796 hot, with a full-tonnage train behind her, over an eighteen-hour hilly division? If it is to be so interpreted, we can answer with full fervor, that "Primary Railroading" is one of the mainstays of our experience, and, that far from being a matter of discomfiture, we count its delightful uncertainties amongst its greatest attractions.

Favoring the College Man.

Someone has been quoted as saying that the college man has not an intimate enough knowledge of the men in the ranks, and that when he is in the ranks he is favored to the detriment of the other apprentices. It must be admitted, that, at first, the college man does not have the desirable knowledge of his fellow-workers so essential to success, but, it is just this failing which a rational apprentice course is expected to correct. The man is brought right into contact with the actual condition, and what is more, he is generally placed in this position at a time when it is likely to impress him most. Of course, getting back to first principles, everything depends upon the man himself. The mistake—and mistake it is—of favoring the special apprentice to the detriment of the rest of the shop has fortunately been avoided here. The company would not be so foolish, and the student himself is carefully warned to avoid it.

A Thinking Course.

We dislike to be constantly referring to a few individuals, but there is another statement of Mr. Basford's, which we wish to take up. He said that a degree could be got without thinking.

We cannot, with justice to ourselves, agree that a man can, without thinking, complete the Railway Course at McGill University together with the apprenticeship training of the Canadian Pacific. Where conditions are such, that even a freshman can obtain seventy-five or ninety dollars a month, on some such employment as inspecting paint or the like during the summer holidays, it requires no little thought and courage on the part of the student to enter a career which demands so rigorous a training with so few immediate returns. He has had ample opportunities for serious reflection throughout the earlier stages of his experiences, and only a fixedness of purpose would endure the ridicule of his better-paid associates.

That is why we term our work a "thinking course." It may be true elsewhere, or perhaps only in Montreal, but there is absolutely no doubt that when a student enters railway work he has thought so much about it, and its future, that he is there to stay, and to develop his best.

Unfair Comparison.

There is one thing, however, that appears a little unreasonable, and that is the tendency a great many people have of comparing college graduates immediately with a man, generally older, and who possesses more experience. They ask why are not college men as good as a roundhouse foreman. As a matter of fact there are a number of graduates who have made good as roundhouse foremen, but it seems a little hard to expect a man with little practical experience, to measure up to another, who has been a number of years on the job. Four or five years after graduation should be the time for considering their respective efficiency.

What Colonel Johnson said in 1904, that the student expects too much from the railroad, and the railroad too much from him was unquestionably true. The majority of students now have found out that Mr. Buell was right when saying that college men, if they "know" what they want, can generally get it on a railroad, and they are also alive to the fact of the constantly-increasing considerate treatment they receive.

A Tribute From Experience.

It is now being found that there is very little of that disagreeableness that many past writers said accompanied the special apprentice. Perhaps there was suspicion at first, before the machine had been oiled, so to speak, as to just what a man's object was, but after a little explanation there was generally nothing but an interested and helpful spirit shown the student. Nothing gives the writer more pleasure today than to go back to the scene of his old job and be cordially received on all sides. It has such an encouraging effect on a man, and is extremely conducive towards building up a spirit of loyalty towards the company, and a feeling of respect and regard for the employees. We think that there will be no cases of a student leaving because he thought he was not getting what he wanted or he had not been treated in the right manner.

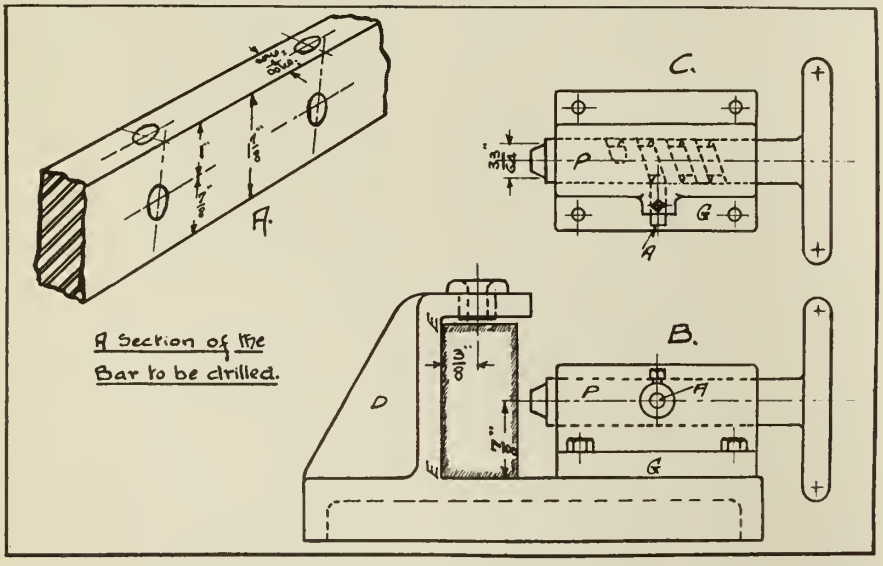
No college man, if he has truly had regard to himself, will desire to offensively overrule the opinions of others, but, of course, there are poor college men, just as there are poor railroaders, or poor farmers, but we would ask you to seek out the average individual before passing judgment on the whole class.

Hon. Nathaniel Curry, president of the Canadian Car and Foundry Co., stated last week that there had been material improvement in car-building orders since the several plants of the company had been opened recently. The passenger car departments at the Montreal plants, Senator Curry said, are working to capacity, and the freight car departments at about 40 per cent. Both the passenger and freight car departments at Amherst are working to capacity.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

A JIG FOR SECOND-HOLE DRILLING.



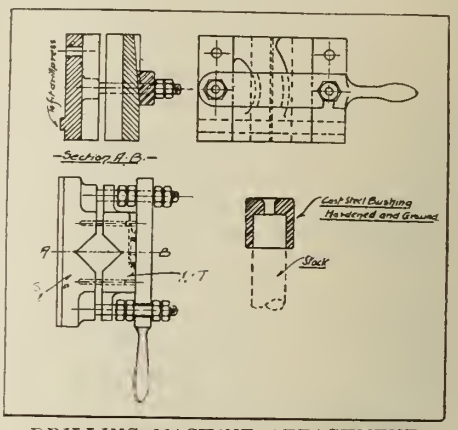
By D. A. Hampson.

SOME TIME ago a drilling proposition presented itself which is best understood by reference to the drawing (A). Steel bars ¾-in. x 1⅞-in. were to be drilled as shown—one ½-in. hole to go clear through the short way, and the other ½-in. hole drilled in the edge and running down to meet the first one. Various lengths of bars were to be drilled and various centre distances were required. Nothing very difficult about that job! No, there is not, except to keep the two matched holes correct and interchangeable with a pair drilled five years hence.

The means employed for keeping the first holes right, and for spacing them, will not be considered. For the second hole, some quick method of indexing, of holding the bars while drilling, yet one of low cost and sure action was required. The jig made for the work is shown at (B), which is an end elevation, and at (C) which is a partial top elevation. The body (D) is of cast iron, 18-in. long, of ribbed section, having a planed floor on which the bars rest, and a right angle side shown by the line (EE) against which they are clamped. A bar in position is shown by the hardened drill is guided by the hardened tool steel tool steel bushing above.

To an extension of the floor is screwed a casting (G) which is equipped with the clamping and indexing mechanism. A 1-in. hole is bored through (G) at ⅞-in. from the base which is the distance of the first hole from the edge of the bar. A plunger (P) is nicely fitted in this hole and is to be turned by the handwheel at the free or outer end. This plunger has a hardened conical end which enters the hole already drilled and on being screwed in, brings the hole immediately under the grinder bushing. The large end of the core is 33-64-in. which still takes care of a bar accurately, even though the drill has been cutting a few thousandths large. In and out movement of the plunger is secured by cutting a square thread near the centre of the plunger and locking the plunger in by the pin (A) which has a flattened end ⅛-in. wide by ½-in. long entering the 4 pitch thread. For the work it has to do, this thread is not steep enough to slip, and yet it is so fast that a turn, at the most releases and tightens the work.

After drilling one hole, the handwheel is turned backwards, the bar slid along to approximate position for the next hole, from which the pointed screw draws it into exact place for drilling. This threaded core-pointed plunger proved a happy combination of index pin and clamp that for speed and utility utility would be hard to beat.



JIG FOR SECOND HOLE DRILLING.

DRILLING MACHINE ATTACHMENT

By J. Davies.

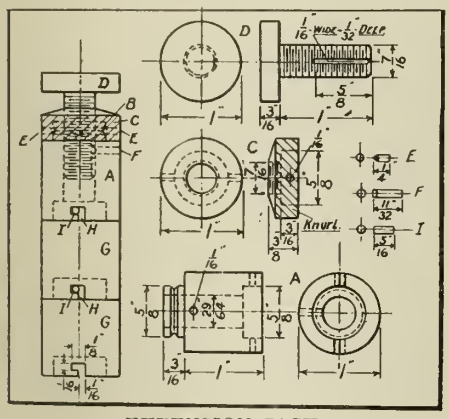
THIS tool was designed by the writer for use in drilling holes in the ends of a lot of cold-rolled shafts. It also makes a very quick and fairly accurate centering device for lathe work. By removing the check nuts and lever, the two pieces which comprise the apparatus

DRILLING MACHINE ATTACHMENT.

can be used as parallel vee blocks for general drilling machine work requiring these.

A small casting (S) is made to bolt up against the side of the drilling machine, and if the drilling machine has a round table, with no convenience for bolting work to the side, it will be necessary to get a small angle plate for the purpose.

A tongue or strip is machined on the back of the casting at right angles to the vee, which will automatically set the latter parallel to the drill spindle. Another small casting is made to slide over the first one, with machined vee to correspond. In machining these two pieces the backs are done first. They are then placed on the shaper or planer so that both vees are machined together, otherwise they cannot be used as parallels. Casting (T) is kept in position by two dowel pins, as shown. The work is held by means of the lever, which has a wedge piece riveted on the centre. This bears hard on a corresponding taper on casting (T). The reason that the taper is slightly below the general surface of casting (T) is so as not to interfere with its use along with casting (S) as a pair of parallels.



The tension on the lever is adjusted by the check nuts to suit different sizes of bars. The range of the adjustability of the apparatus could be considerably increased by inserting false pieces into the vee. The piece to be drilled is dropped into the jig, and one yank of the lever securely fastens it parallel to the drill spindle. The hardened steel bush is placed on the end and the piece is drilled.

The removal of one piece and setting up of another can be done in a fraction of the time that would be required to do the same operation in an ordinary lathe chuck, and, if the hardened bush is carefully made the work will be more accurate than if done on lathe. A skilled operator is not required, and the lathe is at liberty for more important work.

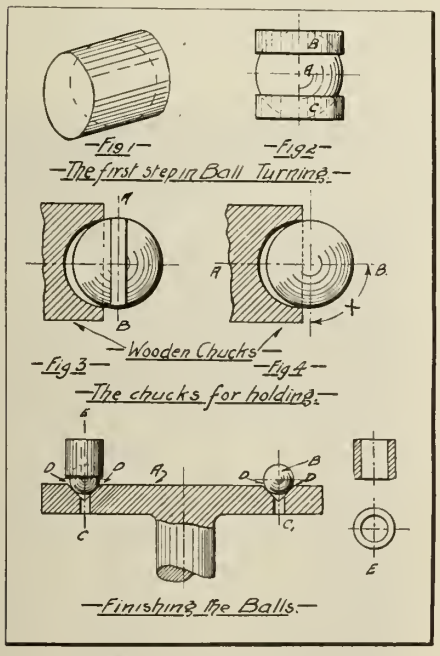
JACK WITH EXTENSIONS.

By J. E. Cooley.

A SIMPLE design of a jack and extensions used mostly for drill-press work is shown in the accompanying sketch. The base, (A), Fig. 1, is made

EXTENSION JACK.

of cold-rolled stock and has one end turned up, in which is cut a small groove at (B). A knurled nut (C), containing the adjusting screw (D), is placed on the base and held in position by two pins, (E), which are driven in, one on each side of (C), the point of the pins entering the groove (B). A pin (F), is also driven in the base (A). This enters the groove in the adjusting screw and prevents it from turning. Turning the knurled nut, (C), raises and lowers the adjusting screw (D). The extensions (GG) have a pin (H) put on the small end which locks in the slot (I), as shown. There is also a pin and slot on the opposite side of the extension. The parts of the jack and extension are shown in detail and require no extended description. They are made of cold-rolled stock. The knurled nut (C) is beveled as shown, so that the chips will fall away from the screw.



TURNING BILLIARD BALLS.

By A. V. Francis.

THE average mechanic has probably speculated on the methods pursued in the turning of billiard balls, and to those not familiar with these methods the accompanying article and illustrations will probably be of interest.

In general, these balls are chucked in a wooden chuck. The ivory tusk is cut in blocks as shown in Fig. 1. These are chucked in a special machine which cuts a fairly good ball (A) out of the centre, and leaves two rings (B) and (C) at the end which are finished to use as harness rings, Fig. 2. The machine-made ball is then chucked in a wooden chuck, shown in section, by Fig. 3. The ball will hold quite securely before its centre is flush with the face of the chuck. A light cut with a scraper is then taken at (AB), and the ball is changed so that the points (AB) are in the position shown in Fig. 4. The outer line shows the original size of the ball, and the inner one the scrape that has been taken on (AB). Now, if the turner will carefully follow the arc (X) and cut down to the inner line for the surface of the part which has been scraped it is obvious that he will have finished half the ball to a true hemisphere. He then takes the ball out of the chuck, turns it around 180 degrees and finishes the other half in the same way. Some billiard ball turners turn a ring like (AB) and then turn another ring at right angles to the first; then another at right angles to the second, and so on until the job is done. All these operations are done with hand tools.

A ball slide rest can be made by mounting an ordinary slide rest on a central stud and having a worm and wormwheel to give the circular motion. If the balls are made in large quantities and only a few sizes, a tool can be made

TURNING BILLIARD BALLS.

for each size which will produce uniform work and accurate results. The face-plate (A) is of wood or iron covered with wood. In it is turned the V groove (B) with openings (C), so that the turnings from the balls can be easily removed. Strips of leather cemented to the wood so as to give a bite to make the ball rotate, are shown at (D).

The tool is made of steel hardened and ground internally the size of the ball. The balls are placed one at a time on the runway and the tool is put on top. The face-plate being set in motion, the ball rotates and is scraped round by the tool (E), and as soon as the ball reaches the size of the ring it goes inside and the cutting ceases. With composition balls the operation should be very simple as these can be moulded pretty nearly to finished size.

Personal

J. H. Plummer, president of the Dominion Steel Corporation, was in New York last week.

E. W. Knight, manager of Frankel Bros., metal dealers, Toronto, returned this week from a holiday in England.

John W. Fraser, superintendent of the open hearth department, Nova Scotia Steel and Coal Co., has resigned.

A. R. Williams was in Montreal early this week, attending a directors' meeting of Williams & Wilson, Ltd.

W. H. Young, Winnipeg manager for the A. R. Williams Machinery Co., will be in Toronto this week to confer with officials at the head office.

J. H. Henley has been appointed manager of the Safe Department of the Canadian Fairbanks-Morse Co., Ltd., Toronto He was formerly connected with the Winnipeg house.

F. C. Brunke, manager of the United States Steel Products Co., Toronto, was in New York this week, and met Mr. J. Farrell, president of the United States Steel Corporation.

William Brown has been appointed resident representative in St. Catharines, Ont., for the Canadian Fairbanks-Morse Co., Ltd. He will watch out for the Welland Canal trade.

H. K. Clark, machinery salesman for the General Supply Co., Toronto, has severed his connection with that firm, and is now connected with the Wilt Twist Drill Co., Walkerville, Ont.

W. Furniss Clarke has resigned his position as manager of Geo. Anderson & Co., of Canada, Ltd., having accepted an appointment as general superintendent with Armstrong-Whitworth of Canada, Ltd. The appointment is effective March 1st, and on February 28 Mr. Clarke is leaving for England to spend some time visiting the plants of the parent company.

TAKING CARE OF HIGH GRADE HELP.

By C. T. R.

THE question of taking care of high-grade help in small towns is one that has bothered countless firms throughout Canada and the United States. The hetter class of workmen, men who are competent mechanics, and know they are such, feel that they have a right to he well housed and entertained. If conditions in the town or small city are such that decent rooms and good quality board cannot be obtained, and, if there is no place of high-class amusement where they can be entertained without loss of self-respect, you can figure that it will be hut a short time hefore they will move on to a city that furnishes what that town lacks.

BOWLING ALLEY FEATURE.

Windsor, Vermont, is a small town with hut one industry, the manufacture of Gridley Automatics. High-grade mechanics are employed exclusively, good wages are paid, but, until, recently it has been almost impossible for the management of the Windsor Machine Company to keep their help beyond a certain length of time. Private families, who took hoarders as an "accommodation," and restaurants who openly took them for profit, furnished an indifferent grade of board at rates which did not correspond with the quality. The men demanded more than this, and not being ahle to obtain it, went elsewhere. There was, also, no gathering place except street corners. Time hung heavy on men's hands, and discontent was evident at all times.

Well into the winter of 1912, a few of the most enterprising townspeople, backed by the Windsor Machine Company, formed the Windsor Club. As no other building was availahle at that time, the old shop, formerly occupied hy the machine company was remodeled at comparatively small expense, into one of the most interesting and progressive club rooms of New England. Four hundred memhers were enrolled, and after nine months of successful operation, the register shows approximately the same number of paid members. The memhership fee was fixed at five dollars a year, payable quarterly in advance, and a small fee has heen charged for the use of the bowling alleys, billiard and pocket billiard tables and the shower baths. These charges have placed the club on a self-supporting basis.

Men without homes gather here for their evening's amusement, and Wednesday night of each week sees the dance floor, which is 100 feet by 50 feet, and prohahly the best in the State, covered with an orderly and pleasant company of the memhers and their friends. The employees of the company meet the management under circumstances that further a better acquaintanceship, and with this hetter understanding, are capable of developing into better workmen and better citizens.

After seeing the club well started, it was impressed more firmly than ever upon the manufacturing company that better eating and sleeping accommodations would have to be provided for the men who were hecoming more valuable each day. There was plenty of room left in the old factory huilding to install a modern restaurant with sleeping rooms attached, and work was commenced early in the summer of 1913, on remodeling the building. Oil-soaked floors were torn up and replaced with a good grade of hard wood; partitions divided one long shop department into twenty-five sleeping rooms—four of these with hath connection—and in a very short time a model restaurant was fully equipped to supply the needs of both employees of the company and transients.

An old planer room was converted into a perfectly equipped kitchen having every convenience that could he purchased—refrigerator, 12 ft. by 24 ft.; steam tables, dish washing machine, electric potato parer, and many labor-saving devices that enable the best service to be

RECREATION HALL FEATURE.

obtained. Artificial refrigeration is used, together with artificial ice for the table.

When the machine company moved to their new and up-to-date plant in 1910, they left their engine, boilers and dynamos in the old factory. These have been put to use in furnishing light, heat and power for the "Windsor Club" and "Windsor Club Dining Room," thus reducing this expense to a minimum.

The results of the whole investment are proving satisfactory in every way to the Windsor Machine Co. Men do better work when well fed, they are content to stay in a town which furnishes good clean amusement and recreation outside of working hours, and there is a closer application to and interest in their work than has ever been noted in the past.

Manufacturers are realizing more and more that it is necessary to take an interest in their employees after the shop doors close at night, and there are more firms than one who would do well to convert some old unused building into a recreation hall for their employees.

Trade Gossip

The Canadian Dredging Co., Ltd., has increased its capital from $750,000 to $1,500,000.

The Goldie & McCulloch plant, at Galt, narrowly escaped destruction on Friday last when a fire destroyed the adjacent plant of the Shurly-Dietrich Co., Limited.

The Renfrew Machinery Co.'s traveling salesmen and agents were guests of the company at the fourth successive banquet given in Renfrew, on Wednesday, Feb. 4.

D. McKenzie, Guelph, Ont., maker of hack saws, bench drills, engine lathes, shapers, etc., is now doing business under the name of the D. McKenzie Machinery Co.

The Provincial Boiler Inspection Department, Toronto, will send a man to Pittsburgh to inspect 25 boilers which a sub-contractor will bring in for use on the new Welland Canal.

Steffens & Nelle Aktiengesellschaft, a German company, has been authorized to trade in bar iron, hoop iron and shaped iron sheets, and plates, mild steel girders, etc., in Ontario; Samuel King, Toronto, attorney.

Carbic, Ltd., Toronto, have recently supplied a 75-ft, capacity portable oxy-acetylene welding plant to the Toronto Street Railway, and a 150-ft. capacity plant to the Dominion Dredging Co., Port Dalhousie, Ont., the latter being for work on the new Welland Canal.

N. S. Steel Output. — The output of the Nova Scotia Steel & Coal Co. for the month of January shows coal mined, 60,600 tons; pig iron made, 5,900 tons; steel made, 77,000 tons; ore mined, 43,000 tons.

The National Steel Car Co. first annual report, issued on Monday, showed net profits of $157,153 after deducting $86,074 for renewals and repairs made during the year. Sufficient orders are on the books to enable the works to be operated without interruption until late in the spring of 1914.

Duty on Implements.—There is a well-defined rumor in circulation to the effect that the Government has in view a reduction of the duties on agricultural implements. It is stated that this will be announced in the coming budget speech. The report is that the reduction will be, perhaps, slightly more than that proposed by the reciprocity agreement, which varied from 2½ to 5 per cent.

Duty Reduced.—The customs authorities at Ottawa have agreed to reduce the amount of duty payable on the plans of Sir John Wolfe Barry for the construction of the second narrows bridge at Vancouver. The cost of the work will be approximately $2,500,000, and duty to the extent of between $5,000 and $6,000 was demanded, but on representations being made this has been reduced by 30 per cent.

Auto Industry Reviving.—The application for space and the great interest already taken in the coming Automobile Show to be held in the Exhibition Grounds, Toronto, from the 14th to the 21st of February is not only an advance indication of the success of the Show, but also of the revived interest in the automobile world. Those qualified to pass an opinion say that prospects were never better than they are this year.

The Theodore Kipp Co., recently opened an office in Winnipeg as mill engineers and general machinery dealers. Mr. Kipp installed all the machinery for the new mill at Moose Jaw for the Robinhood Mill Co., and has had wide experience with general, power plant and milling machinery. The company is well equipped for advising on and carrying out new work and is in a position to supply the necessary machinery, having a number of agencies for various lines, such as Worthington pumps and condensers, International Gas Engine Co.'s products, Foxboro recording instruments, Green chain grate stokers, Richardson-Phenix lubricators, Diesel engines, tubular boilers, concrete chimneys, steam specialties and recording instruments, etc.

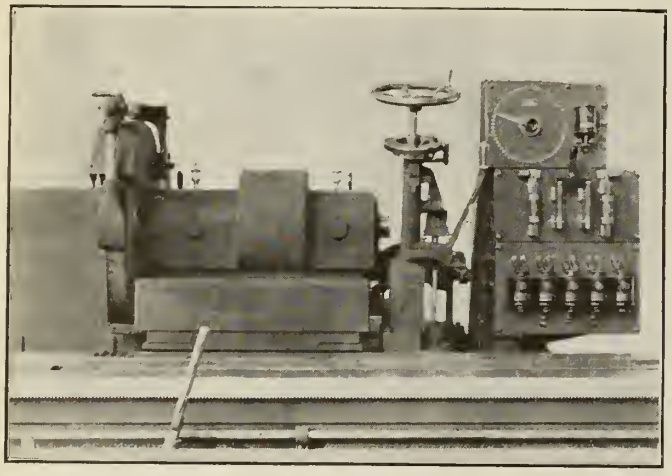
The Nova Scotia Car. Co. held its annual meeting on Wednesday, Feb. 4, at Halifax. Reports were presented and officers elected. Dividends were paid on the first preferred stock amounting to $42,574. The president reported business slack for the past three months, but the company increased its earnings 20 per cent. last year, notwithstanding the fact that the plant had been working only about eight and a half months. It is understood that there are orders on hand for about 200 cars. The officers elected were: President, O. E. Smith; vice-president and general-manager, F. N. Brown; directors, J. R. Douglas, F. B. McCurdy, J. R. Lamy, A. M. Bell, E. J. Clayton, G. Fred Pearson and Hector McInnes.

Made In Canada.—"Wherever possible, ships to be used in the Canadian service will be built in Canada." This was the statement of Hon. Mr. Hazen made on Tuesday, Feb. 3, during the discussion of marine department estimates and the policy was heartily approved by members on both sides. "My policy," said Mr. Hazen, "is to have all vessels possible built in Canada. In calling for tenders to-day we are insisting that vessels for the marine department must be built in this country. There is no protection for shipbuilding in Canada and the rate of wages is lower in Great Britain than in this country. Canadian shipbuilders are at a disadvantage. Two ships are being built for us at a Western Ontario shipbuilding plant, that of Collingwood, and tenders for ice-breakers, which have just been issued have a clause that they must be built in Canada."

Farm Machinery Contracts Bill.—When an Act respecting agreements for the sale of farm machinery came up for consideration before the law amendments committee of the Manitoba Legislature, last week, J. B. Hugg, who appeared for the Manufacturers' Association, argued that while the manufacturers or the implement dealers were not opposed to the Bill, they desired that a reasonable and uniform contract should be made which would be binding to vendors and buyers alike. The Bill as proposed, he continued, would work an injustice on the manufacturers of farm machinery as against other manufacturers. He admitted that legislation of the kind sought for in the Act had been to a large extent brought on by the implement dealers themselves by reason of their iron-clad rules which were often impossible. The committee asked that a statutory contract might be drawn up which would extend to goods other than farm machinery.

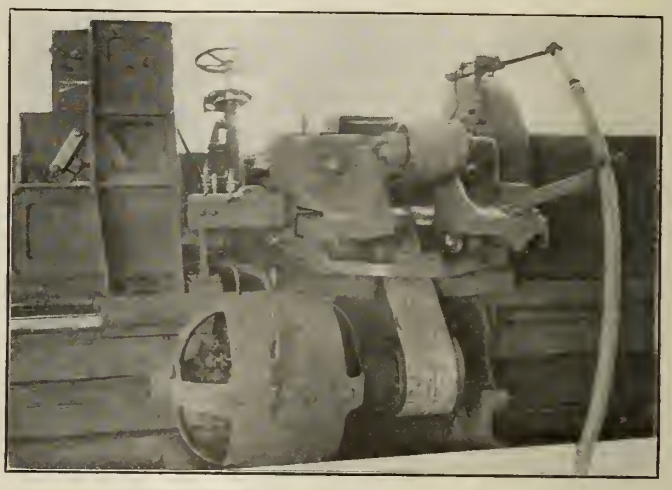
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.



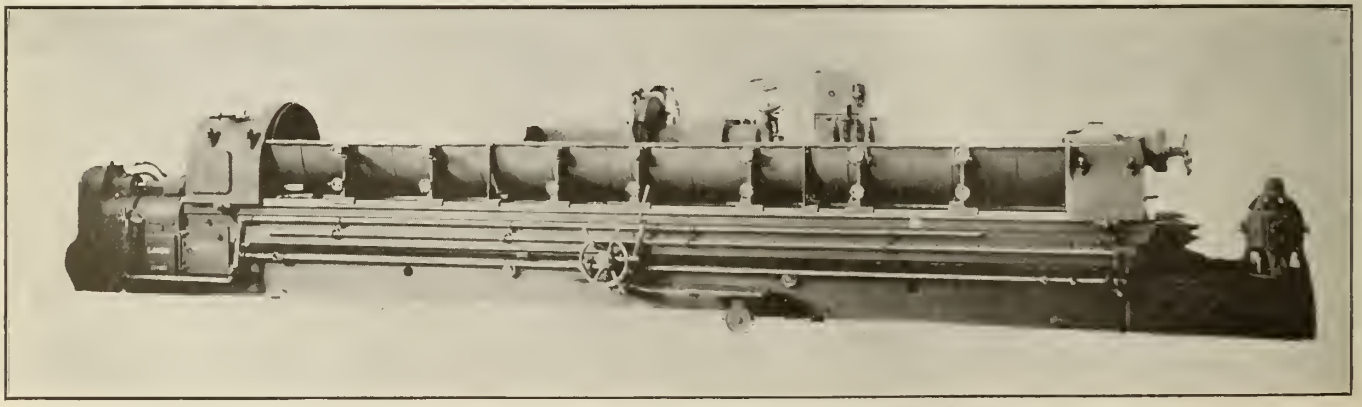
ELECTRICALLY-DRIVEN PLAIN GRINDING MACHINE.

THE accompanying description and illustrations refer to a large electrically-driven plain grinding machine, just completed by the Landis Tool Co., of Waynesboro, Pa. This machine has a range for work 30 inches in diameter and 20 ft. in length. As will be seen, it is driven by three motors; one for the grinding wheel, one for revolving the work and traversing the grinding wheel, and one driving the water pump. The work and traversing motor belts with the gear box at the end of the machine, which is arranged with clutch mechanism so that the drives can be started and stopped independently, or together, independent of the motor. The motor runs at a constant speed, and the speed changes of both the work and wheel traverse are made by an arrangement of gear shifts and clutches, all of which are operated from one position at the front of the machine. There are 16 different work speeds, ranging from 2 to 45 revolutions, and 10 changes of wheel traverse speed, ranging from 2½ in. to 84 in. per minute.



The grinding wheel is driven by a variable speed motor, the speed of which is controlled by the electric apparatus, as shown mounted upon the main wheel carriage. The standard size wheel for this machine is 30 inches in diameter, with a wearing range of 8 inches dia., for which the electric controller is arranged to give the proper cutting or peripheral speed with the wheel at any size within its range of wear.

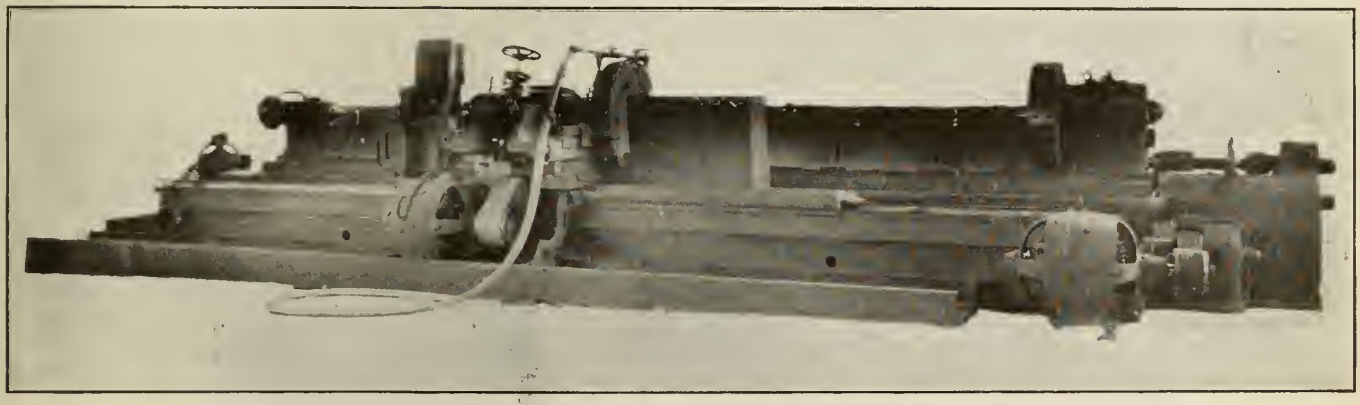
As will be observed from the rear view, the grinding wheel motor is mounted upon a separate carriage, which travels on a track formed with the base of the machine. These carriages are entirely independent, except for an arm connection for propelling the motor carriage with the traversing movement of the wheel carriage. The motor carriage is mounted on large rollers, which are fitted with ball bearings. The track surfaces upon which this carriage travels, are protected by metal guards. The electric current is transmitted to the wheel motor through sliding contact shoes and feed wires located along the body of the machine. These wires, also, are protected by a shed-form metal guard, to prevent anything from falling on them from directly above.



The grinding wheel slide for feeding the wheel to and from the work is arranged with a rapid mechanical feeding mechanism, which is operated by the vertical lever located between the feeding hand wheel and the motor controller. This is clearly shown in the front view, and is for the purpose of moving the wheel away from the work quickly, when changing from piece to piece, or from one size to another, in case of various diameters being ground on the same piece, and for feeding the wheel in quickly to the grinding position. The action is for the transverse feeding movement of the wheel to be in the same direction as the movement of the operating lever. To feed to the work, the lever is pulled in the same direction, and the reverse, when moving away from the work. In addition to this, there is the

FRONT VIEW GRINDING WHEEL HEAD AND ELECTRIC CONTROL APPARATUS.

GRINDING WHEEL DRIVE FROM REAR.



FRONT VIEW ELECTRICALLY-DRIVEN PLAIN GRINDING MACHINE.

usual hand feed, as well as automatic, for feeding the wheel at the reversing points. The grinding wheel motor is controlled by an automatic motor starter and field rheostat, with rheostat relay.

This makes a very efficient arrangement, as the controller can be set to give the wheel the proper peripheral speed for any diameter within its wearing range, and the motor is then operated by an ordinary knife switch. The arrangement gives a positive control of operation, and, with the automatic starter, the speed picks up gradually after the starting switch has been thrown into contact.

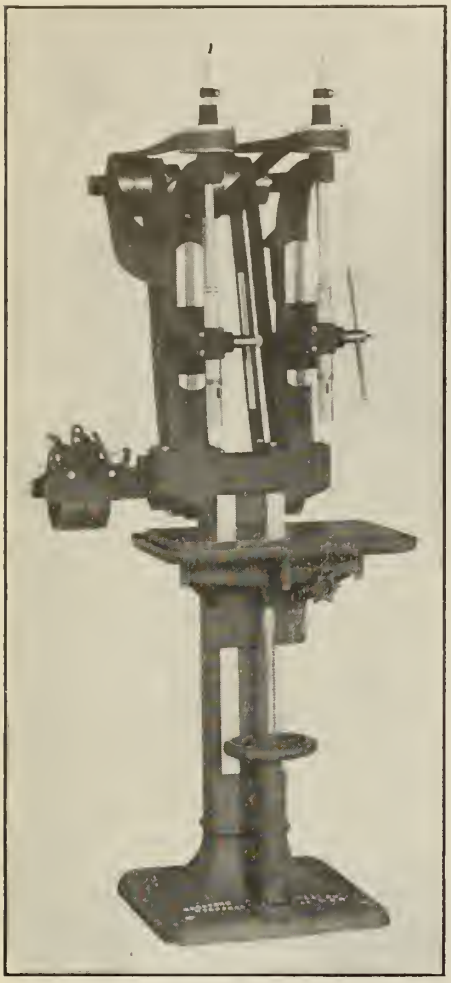
A feature in the construction of this machine is that all bearings of spindles which run continuously while the machine is in operation, are, without exception, made of bronze, and the spindles are of hardened and heat-treated steel. The starting box of the water pump motor is mounted directly upon the motor itself, which places it in a very convenient position to the operator. The starter for the work drive and traverse motor is not shown, as this is mounted as may be desired when the machine is installed.

The machine is intended for grinding a line of large shaft work, the largest piece to be handled occupying the full distance between centres, the diameters ranging up to 24 inches. It is strictly a manufacturing grinder, and is, therefore, well suited for other work, such as engine crank shafts, steam turbine shafts, armature shafts, and heavy roll work. The machine is also built for 40 inches swing, when desired.

REAR VIEW ELECTRICALLY-DRIVEN PLAIN GRINDING MACHINE.

BORING MACHINES FOR LOCOMOTIVE CYLINDERS.

THE Newton Machine Tool Works, Philadelphia, Pa., have recently designed and built two very large boring machines for the purpose of boring locomotive cylinders, and having the circular valve chambers bored from the solid cylinder casting in the shortest possible time. In order to accomplish this purpose, it was considered that with one setting of the work for all operations, much time formerly wasted would be saved, therefore, the machines were fitted with compound tables having transverse, longitudinal and vertical adjustment, to permit of first boring the circular valve chamber, then the cylinder, so that while the cylinder is being bored, the valve chamber bushing may be fitted, and this bushing finally bored out without disturbing the location of the work on the tables. It will be noted from the illustration that particular care has been taken to cover the parts that might be dangerous to the operator. The machines were built to the following specifications:



The work tables have four elevating screws. The 7-in. diameter spindle is fitted with double spline, has a continuous travel of 140 inches with six changes of gear feed and rapid power traverse in both directions, giving capacity to bore and finish both ends of cylinders 50 inches long. The cross adjusting table is 54 inches wide by 72 inches long, and the vertical adjustment gives a range of from 39 in. to 51 in. from top of table to centre of spindle. The maximum distance between facing arms is 60 inches. The net weight of the machine is 75,000 pounds The machine is driven by 20 h.p., General Electric motor, running at 400 to 1,200 r.p.m., giving spindle speeds of from 2½ to 7½ r.p.m. The main drive for the spindle is through a steep lead worm wheel having a bronze ring mounted on the spindle sleeve, engaging with a hardened steel worm, fitted with roller thrust bearings, both entirely encased for continuous lubrication; and the drive is so arranged that the fast power traverse feature of the spindle may be used while the spindle is not rotating. This fast power traverse, the rotation of the spindle, and the power elevations on the table may be disengaged or engaged by levers located on the table of the machine, both alongside the main head and the outboard bearing without stopping the motor.

BORING MACHINE FOR LOCOMOTIVE CYLINDERS.

The feed is taken from a gear box having eight gears distributed on a sliding sleeve to give six changes without gear removals, and the sleeves are easily adjusted by means of the latch levers shown. The trolley is mounted on the horn for feeding, while the saddle has roller bearings to take the thrust in both directions, and the feed and fast power traverse is maintained through a rotating screw.

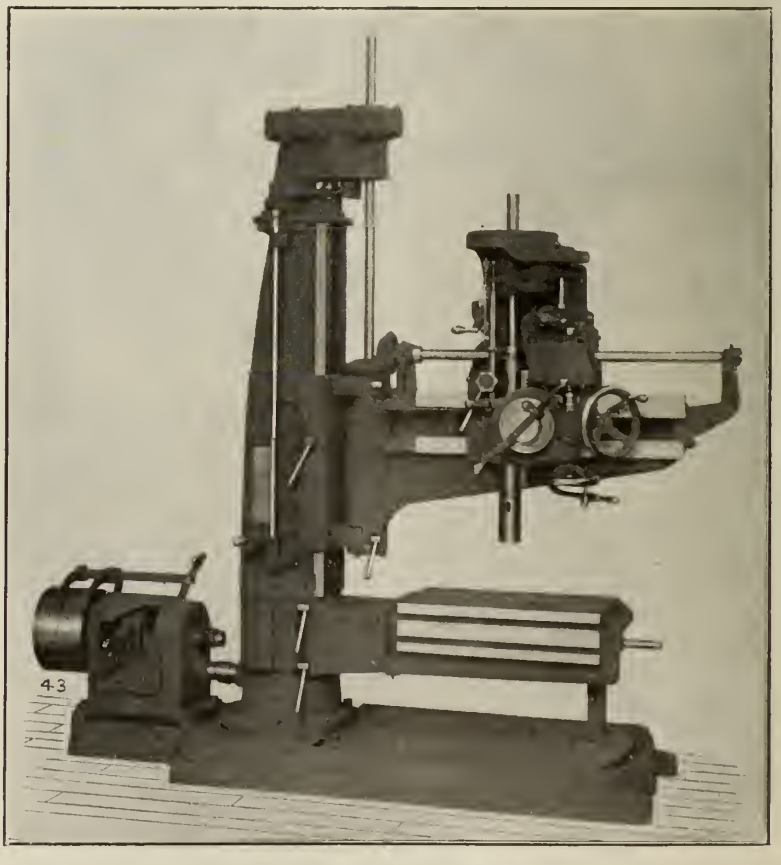
The outboard bearing has independent in and out adjustment, so that the cylinders may be mounted on the main table and adjusted to come within range of the facing head on the main spindle sleeve, the outboard bearing being then

MULTIPLE SPINDLE FLOOR DRILL.

adjusted to bring its dependent facing head within range of the adjacent spindle flange. The facing heads, it will be noted, have all the latest features, including eccentric clamp, permitting of rotating the spindle sleeves while the facing heads hang idle without removal, if desired.

MULTIPLE SPINDLE SENSITIVE FLOOR DRILL.

MULTIPLE spindle sensitive drills have always been recognized as an economical means for increasing production and reducing manufacturing costs. They are, therefore, an important factor in modern shop equipment. In designing a new line of multiple spindle drills, The Rockford Lathe & Drill Co., Rockford, Ill., have made a special effort to produce a very simple, accurate and efficient machine, convenient to operate and of ample weight to handle the rapid production that up-to-date methods demand.



The column of box type [illegible] erous dimensions, with extra wide dovetail slide is well braced and very rigid. The table which is raised and lowered by handwheel has adjustable supports and may be removed for replaning when badly worn. The spindles are of the best quality high carbon steel, forged and ground. They are provided with ball thrust and stop collars and are counterbalanced by weight and chain. Each machine is furnished complete with belt, ready to run as illustrated. They are also built with three and four spindles. The leading dimensions of the Rockford No. 210 "Economy" Floor Drills, being the name by which they are known, is as follows:

Distance from column to centre of spindle, 7⅛ in.; capacity, ⅝ in.; greatest distance from spindle to table, 27 in.; distance from centre to centre of spindles, 10 in.; vertical travel of spindle, 5½ in.; vertical adjustment of head, 9 in.; hole in spindle conforms to Morse Taper No. 2; diameter of spindle, ¾ in.; size of table, 12 in. x 20 in.; face of cone pulley, 1⅝ in.; size of tight and loose pulleys, 8 in. x 2¼ in.; speed of tight and loose pulleys, 350 r.p.m.; net weight, 655 lbs.

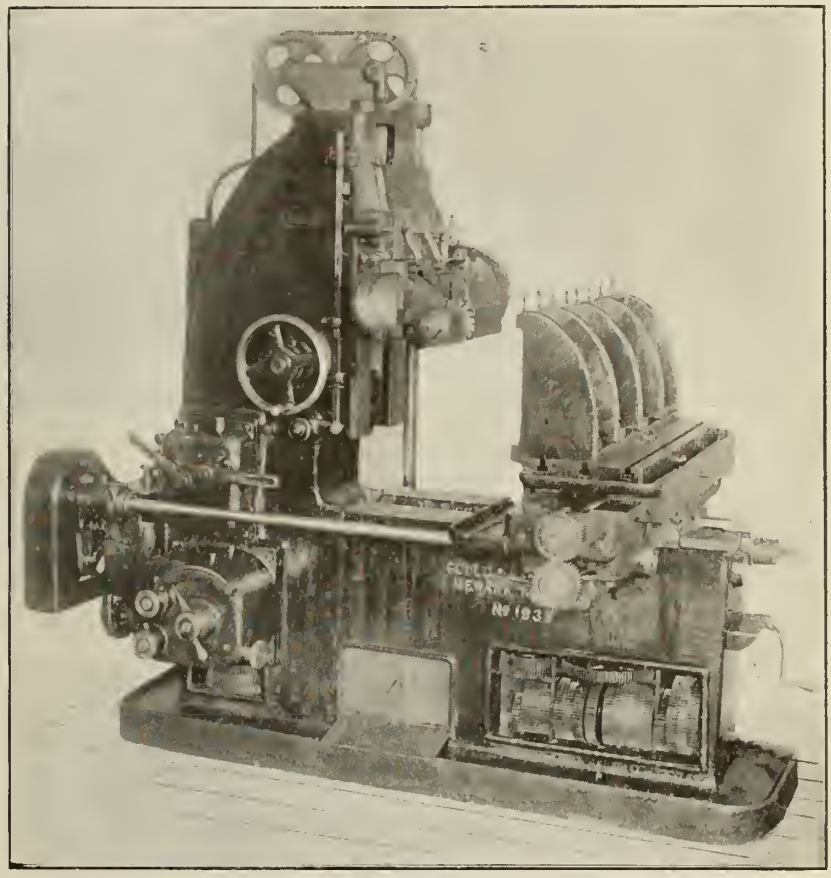
NEW HEAVY DUTY RADIAL.

THE 3-ft. heavy duty box column radial, illustrated herewith, is the latest product of the Fosdick Machine Tool Co., Cincinnati, O., and, with the exception of the column, arm, and table, is the same design as their highly developed round column machines, the first of which was described last August. This machine is particularly adapated to a great variety of work, correct feeds and speeds being instantly available for all sizes from 5-16 inch carbon to 3-inch high speed drills. A very complete metal speed and feed plate is conveniently attached to the column. For heavy drilling or tapping in steel, an oil channel is cast around the base, which drains into a large reservoir under the column where a pump and piping may be attached. For the smaller steel drilling and tapping operations, a liberal channel has ben provided for the table which drains to one corner under which any receptacle for the lubricant may be placed, thus avoiding the use of a pump and return piping.

Special attention is called to the design of the column and arm, the former being of a heavy one-piece box section, internally ribbed; and the latter of the pipe and beam section, which has proven itself a most rigid combination. This construction also permits the long saddle bearing to be securely gibbed to the wide flat face of the column, making sagging of the arm impossible, provides means for taking up any amount of wear, and brings the binder levers up close to the operator. The arm rests on

THREE-FOOT HEAVY DUTY RADIAL DRILL.

a special ball bearing, which reduces the effort required to swing from one position to another to practically nothing, and as the pivoting point is in the saddle close to the work, the arm is very sensitive for exact and rapid setting.



The elevating screw which raises and lowers the arm on the highest speed by power is suspended on a ball bearing, and the handle is placed below for the convenience of the operator. Safety trips for both extremes are provided. The tapping reverse frictions are simple and powerful. They are instantly adjusted for any amount of wear from outside the enclosure in which the gears run in oil. The back gears are on the head, giving three changes with one lever without stopping the machine. They are located between the spindle and the frictions permitting the heaviest kind of work without slipping. Bevel gears are planed theoretically correct, and spur gears are cut with special cutters to insure noiseless running. They are of steel and hardened where necessary. The feed wormwheel runs in oil.

There are five changes of feed all made by a single lever without stopping. The feed box is placed low on the head giving support to both ends of the feed worm. The speed box provides six changes with a single lever, which is secured by a latch to prevent chattering on the heaviest work. A positive overtake keeps the machine running at a reduced speed, avoiding shock when making changes. All gears are thoroughly encased yet easily accessible, and the lubrication system is very complete. Oil chambers or felt wipers are used, as the location requires, and bearings are of special phosphor bronze bushings. Motor drive may be added to the machine at any time without a special base or speed box, and constant speed, or 3 to 1 variable speed motors of 3 to 5 horse-power may be used. They are connected by rawhide gearing. Although the machine is termed a 3-foot radial, the maximum distance from the spindle to the column at the base is 39 inches and between the spindle and the base, 52 inches. The net weight is 4,200 lbs.

NEW AUTOMATIC RACK CUTTING MACHINE.

OF all machine tools, there is possibly less said and written about rack cutting machines than any other tool. The accompanying description and illustration should, therefore, be of more than ordinary interest.

This new machine, designed for medium class work by Gould & Eberhardt, Newark N.J., is made up of parts of their 26 in. x 12 in. vertical cutting type gear cutter, but in detail has been carried to a degree of completeness that it is an automatic rack cutter in every sense of the expression. It has many novel features. The vertical cutting principle works out particularly well, permitting a powerful cutter spindle drive without a long over-reaching arm or head, the chips and cutting compound thereby clearing themselves and dropping into the base of the machine. The cutting strains, it is figured, are absorbed in the base.

NEW AUTOMATIC RACK-CUTTING MACHINE.

The work table indexes automatically, and while the indexing is being performed, the cutter slide is locked so that it cannot feed down until the indexing is complete. Single or gang cutters may be used, and the machine will index automatically according to the number of cutters being used at one time. The work table indexing screw is of high degree accuracy, and a micrometer is provided so that the table with rack being cut can be moved slightly without disturbing the indexing change gears. This makes it possible to cut racks longer than the machine is rated to do, or to cut sections of racks that are to be matched together as one long piece.

The machine will cut racks up to 36 in. long by 10 in. face in one setting, and will cut up to 3 diametral pitch in cast iron and 4 diametral pitch in steel. The indexing mechanism is positive.

There are 16 changes of feed which may be quickly had by means of a very compact feed gear box. There is also a wide range of cutter speeds, and only one belt is required to drive the entire machine. The driving pulley is completely enclosed in a neat guard, and all running gears are also enclosed.

For shops not having enough racks to keep a machine like this busy, an indexing table for cutting either spur gears or spur and bevel gears, is furnished, and as it only takes a few minutes to change this over for cutting either racks, or gears, it makes an ideal machine for manufacturing and for gear jobbing concerns.

A larger machine of this same design is being built which will cut racks up to 72 in. long by 12 in. face, or gears up to 60 in. dia. by 16 in. face. Its pitch capacity is 1½ diametral pitch in cast iron, and 2 diametral pitch in steel.

Toronto, Ont.—Three tenders were received by the Board of Control for the construction of a complete mechanical filtration plant at Toronto Island at an estimated cost of $1,100,000. They were referred to Works Commissioner Harris for his consideration and report. The tenders were:—Ver Mehr Machinery Co., England, branch office, Toronto, $1,177,054 for filter with steel container, and $1,096,277 for concrete container; New York Continental Jewel Filter Co., $1,197,580; Pulsometer Engineering Co., London, England, $1,733,463.

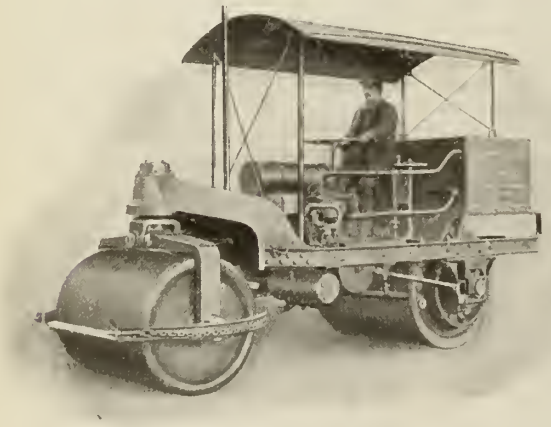
MONTREAL MOTOR TRUCK SHOW.

FOLLOWING a very successful exhibition of pleasure cars held during the previous week, the Montreal Motor Truck Exhibition was opened on February 3, and remained open until February 7. The show was held in the Craig street Drill Hall and about 35 firms were represented. Motor trucks of all types were shown in capacities ranging from 7 tons down to 1 ton or less.

Prominent among the exhibitors were the Canadian Fairbanks-Morse Co., who, in addition to showing motor-boat engines and automobile accessories of every kind, had on view three Mack trucks. One of these, a 3-ton truck sold to the Canadian Consolidated Rubber Co., runs on what are said to be the largest pneumatic tires in the world. They measure 8-in. x 38-in. and are inflated with air at 160 lbs. pressure. They were fitted to this truck largely for the sake of their advertising value. Another Mack exhibit was a 5½-ton power dump truck, one of four sold last summer to the City of Montreal. A full load of crushed stone, gravel or similar material can be dumped from this truck in 11 seconds, the entire operation being controlled by the driver from his seat. The third Mack truck was a very handsome and useful example, recently sold to Warden King, Ltd., Montreal.

John Millen & Son, Ltd., Montreal and Toronto, had an attractive exhibit of accessories such as acetylene head lamps, Columbia dry batteries, Rajah spark plugs, Hoffmann ball bearings, Coventry driving chains, etc.

"FODEN" 5-TON TIPPING STEAM TRUCKS.



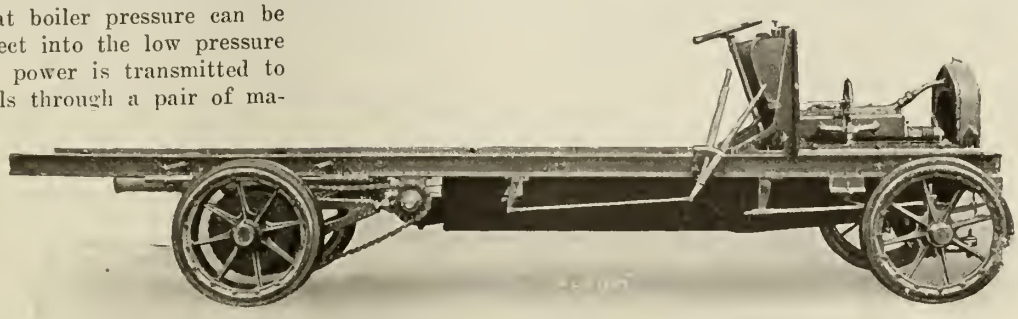
"FODEN" 5-TON STEAM TRUCK.

The Canadian Pneumatic Tool Co., had on view four 1-ton Little Giant trucks of the 1914 model. These are built by the Chicago Pneumatic Tool Co., who state that the present model is a considerable improvement over last year's, the frame having been strengthened and a 4-cylinder engine fitted instead of a 2-cylinder.

The Albion Motor Car Co. of Canada, showed a 2½-ton and a 5-ton chassis, a 1-ton delivery wagon and an 8-ton water ballast road roller. The latter is a particularly compact and well-designed machine and attracted much attention. An interesting feature of the Albion truck is its system of lubrication in which nine pumps give a positive feed of oil to cylinders and bearings in quantities suited to the requirements of each.

Jones & Glassco, Montreal, had on exhibition a large variety of the well-known Renolds silent and roller chains, varying in size from the lightest cycle chains up to roller chains capable of transmitting 80 h.p. They also exhibited the only steam-driven motor trucks in the show. These were two Foden trucks of 6-tons capacity, one being of the dumping and the other of the lorry type. Although so widely used in Europe, steam trucks were only introduced into Canada some three years ago, but have in that time met with much favor in industries where considerable heavy hanling is required.

The Foden steam truck has a boiler of



10-TON WATER BALLAST ROAD ROLLER WITH ALBION ENGINE.

ONE OF THE FOUR 5-TON "MACK" TRUCKS SOLD TO CITY OF MONTREAL.

the locomotive type. This forms the front part of the framework, while the sides of the frame are of the usual channel steel, well tied and braced together. The boiler is fired with coke, coal or wood, as desired. The engine has compound cylinders, 4 inches and 6¾ inches in diameter and is mounted on top of the boiler. In cases of emergency, steam at boiler pressure can be introduced direct into the low pressure cylinder. The power is transmitted to the road wheels through a pair of machine-cut spur wheels and an extra strong Renold roller chain. It is claimed that this truck can readily ascend a 14-per cent. grade under full load at slow speed and can travel 40 miles on its own fuel-carrying capacity.

5-TON ALBION CHASSIS.

The Westmount Motor Co. had a good show of Garford 5-ton trucks, and automobiles. Francais exhibited three Berliet trucks which are the same as used in the French army. These were 7-ton trucks capable of hauling a trailer also carrying 7-tons.

Other well-known cars shown were the Pierce-Arrow, the Commer, the Halley, the Packard, etc. The show was well attended and was a great success in every respect.

BURNING COKE OVEN GAS IN O. H. FURNACES.

AN account of recent progress in the construction of rolling mills was object of which is to make it possible to overcome the disadvantages of burning coke oven gas in open-hearth furnaces. The patent covers a regenerative furnace with gas and air ports at each end, and having means of returning burnt gas from one end of the furnace to the gas port at the opposite end, and also means of introducing coke oven gas into the burnt gas. Coke oven gas is light and has a high heat content.

In applying it to open-hearth furnaces, it has a great tendency to rise and pierce the protecting air blanket, causing great damage to the roof. Its flame also has been of an unsatisfactory and uncontrollable nature, so that the heat units were not used to the best advantage, a larger number of heat units per ton of steel being required than with the other more controllable fuels. Attempts to mix it with air at the ports, as in the case of natural gas, have not overcome these difficulties. It burns close to the port, developing a large amount of heat suddenly with a brush-like scattering flame.

The patentee claims to have remedied these difficulties, and to be able to produce in an open-hearth furnace a coke oven gas flame that is thoroughly controllable. This is done by mixing the coke oven gas in the gas ports with the inert and relatively heavy burnt gases of the furnace.

AIR BRAKE TESTS—PENNSYLVANIA RAILROAD.

IMPORTANT improvements in the braking of heavy passenger cars were described in a paper read before The American Society of Mechanical Engineers at the Engineering Building, 29 West 39th street, New York, on February 10, by Mr. S. W. Dudley, of Pittsburgh. These tests were conducted jointly by the Pennsylvania Railroad and the Westinghouse Air Brake Co. The results are considered the most important recent contribution to the subject of air brakes.

A train of 12 steel cars traveling 60 miles per hour stores up 224,000,000 foot-pounds of energy. This is sufficient to raise the entire train 120 feet. With prevailing brake equipment such a train would be stopped by an emergency application in a distance of 1,600 to 2,200 feet, according to the truck rigging and brake shoe design. The tests showed that this distance has actually been reduced to 1,000 ft., or to within the length of the train; the result being due to improvements in the truck brake design, involving the clasp brake, having two shoes per wheel, and the location of the brake shoes with reference to the horizontal centre line of the wheels, in addition to improved methods of applying the air brakes quickly and simultaneously and at a high pressure. This concerns safety.

The tests emphasized, as has never been done before, the possibilities of improvement in efficiency and economy in regular service operation by proper attention to design and installation in order to permit the realization of the flexibility of improved air brake apparatus. The improvements centre in the electric control of the brakes, giving quick, simultaneous and responsive action. The electric control has opened the way for maximum effect in practice of improvements in practically every factor involved in air brake apparatus, all of which were covered in the development represented by the tests. The tests constitute a progressive development of brake rigging and brake shoes in connection with the scientific study of the air brake as a whole.

Trains of 15 years ago were stopped in about half the distance prevailing in the practice of to-day. Increased size and weight of equipment brought an entirely new brake problem, and these tests have solved it to all persons interested.

THIN SHEET ROLLING.

AN American patent has been granted to Thomas S. Blair, of Chicago, the given a short time ago in "Stahl und Eisen." Sheet rolling, and more especially thin sheet rolling, is an operation which formerly required the presence of a skilled workman, because of the variations of diameter which the rolling cylinders suffered by dilatation, variations which finally showed themselves by inequalities of thickness in the rolled sheet metal. These sheets, besides, ought, in order not to be cooled too quickly and to avoid too great dimensions, to be rolled under several thicknesses after having been bent repeatedly, and this causes risks of adhesion.

In modern sheet rolling mills, the tendency is more and more to substitute for the old rollers automatic trains, which, without the intervention of a workman, roll, bend, re-heat, and cut the sheets. In these rollers, the risk of inequalities of thickness in the sheets and adhesion to each other is avoided by heating the interior of the cylinders, so as to reduce the differences of temperature caused by contact with the sheets, which are allowed to cool slowly.

INDUSTRIAL NOTABILITIES--No. 21

W. D. BEATH was born on a farm, was a farmer at fifty, and still farms. Incidentally, he makes cranes and runways at Toronto. Once upon a time he was wheeling manure in his barn at Oshawa. The floor was uneven, and so much manure fell over the side with the shaking of the wheelbarrow, it made W. D. sit down and think. He noticed that the ceiling had a more even surface than the floor. If only he could wheel manure on the ceiling! Then, visions of a runway with switches entered his brain. He committed his thoughts to paper, and unlike most inventors, he took his drawings to a machine shop, where he got his litter carriers put together on a contract basis. The machine shop was run by the Oshawa Wire Co., since dead. W. D. Beath survived, and his visions too.

One morning the Oshawa farmer awakened to find his device patented in Canada and the United States. History records instances of two men making a discovery simultaneously. Remember Dr. Cook. It was strange, however, that the inventor of the same litter carrier lived in Oshawa. Thus history itself, whether the discovery be at the North Pole or at Oshawa. But watch this undaunted farmer. He set to work to make something even better than his first, and he succeeded. To-day, his first creation is off the market, having been surpassed by its own creator.

Having produced something marketable, W. D. Beath leased his patent rights to The Metal Shingle & Siding Co. of Preston, Ont., for two years, and sent his son to learn the business.

WILLIAM DICK BEATH.

During this time the idea was developed and applied to work in foundries, machine shops and factories. Five years ago, father and son rented a small shop on Teraulay Street, Toronto, where they built their cranes and runways for three years, later erecting their present plant on Cooper Avenue. Now they employ about forty hands, and have a most up-to-date structural shop.

Beath Senior was born an inventor. As a farmer, everything that would go by power he stuck wheels on it. In those days, the farmers of Ontario did not have the labor-saving devices that are the feature of the West to-day. As a result, the Beath farm was a model one for miles around. He still runs a well-equipped 100-acre farm in the same neighborhood, and still has visions. In his younger days he was a specialist in plowing, and took seven first prizes in succession at provincial and township fairs.

He is fond of curling, but his hobby is his new work. You will find him on the plant among his mechanics, as black as the blackest of them. He is nearly sixty now, and has one son, L. B. Beath, who looks after the office end of the business.

So W. D. Beath, president of W. D. Beath and Son, makers of cranes, trolleys, etc., was a farmer until he was fifty, and in nine years has built up a big engineering business, after seeing visions on his farm.

WORKSHOP ARITHMETIC.

BEGINNING with the February 19 issue of Canadian Machinery and alternating each week with the "Questions and Answers for Mechanics" Section, a course of lessons in "Workshop Arithmetic" will be given, and in order that it may have the fullest scope, the subject matter will be treated right from the foundation upwards.

Arithmetic in the workshop and factory is to-day perhaps a more necessary requirement than at any previous period of industrial history and enterprise, and conducing as it does to the cultivation of a sharp and clear intellect, in addition to facilitating and systematically contributing to high degree quantity and quality production, as well as to the advancement of the individual, there is no reason why beneficial results should not follow the study of each lesson, even by those who have got beyond what will be the necessarily introductory part.

WORKMEN'S COMPENSATION IN ONTARIO.

THAT the Workmen's Compensation Bill as drafted by Sir William Meredith has a slim chance in its present form of becoming law in the Province of Ontario, no one at all familiar with its contents for a moment doubts. It would seem also, that the longer action is delayed in its consideration by the Legislature, the more divergent will become the views of the two interests directly concerned, and the more difficult the task of reconciling these.

The Bill is to our mind its own condemnation, if for no other reasons than those of its over-enthusiastic reception by the operatives and its wholesale condemnation by employers. No amount of publicity praising of the Bill on the one hand and decrying it on the other will frighten either side into submission, and the sooner both sides realize that a Workmen's Compensation Bill worthy of the name, and to be effective, will have to embody the views and opinions of the opposing parties worked down to a mutually acceptable basis. Only by employer and employee getting together and not by bull-dozer legislation, will a sane and lasting arrangement be reached.

CARING FOR HIGH-GRADE HELP.

IN another section of the present issue of Canadian Machinery, a brief outline sketch is given of what has been done by the Windsor Machine Co., Windsor, Vt., towards the conservation of that operative help on which it, in common with most manufacturing concerns depend for commercial success. Although our title indicates in a specific manner the particular type of help, yet it must be admitted that care for all classes and grades of operators should be part of the concern of every business enterprise.

In large manufacturing and industrial centres, the problem of securing and holding the necessary help is not usually hard to solve, for rightly or wrongly men and women gravitate there, and in even the most prosperous times, no difficulty is experienced in engaging such additional employees as may be found expedient. There is more "life" about our big cities, more to do in our leisure hours, more in the way of social intercourse and entertainment, and small wonder is it then that help of every kind and type prefers such employment as ensures these adjuncts.

The trend of factory location has, however, been towards the country; if not in a wholly literal sense, at least so far as convenience to the social life of our cities is concerned. It is not necessary for us to dwell on the reasons leading up to this movement; high taxation being responsible for the migration of already established concerns, and high cost of suitable sites, together with high taxation making new propositions hold aloof.

The establishment of a manufacturing plant some miles beyond the confines of a large city means the procuring of and providing for the creature comforts of the various individual units of the help necessary, and while in the initial stages some difficulty is usually experienced, it will be found that, if the management plan for the leisure hour welfare as they do for the work hour output of their employees, there will be no difficulty in both securing and retaining both skilled and unskilled help, even although the village lacks a lot of the tinsel of the city.

Many Canadian manufacturers who have "moved out," like the Windsor Machine Co., have found that profit has come through caring for their help, in addition to that arising from cheaper sites and lower taxation, and it is our belief that if more opportunity were afforded men and women to get "far from the madding crowd's ignoble strife," a higher degree of citizenship would result.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Feb. 9, 1914.—While no marked improvement is noticeable in general trade conditions over those of last week, they are certainly no worse. An optimistic spirit is still very much in evidence and collections are improving surely, if slowly.

In machinery circles, things are still quiet. A few small orders were closed last week, but there will probably be little improvement in the trade in heavy machine tools for some time to come. In the smaller lines, enquiries are fairly plentiful, however, and a few pick-up orders help to keep up the feeling of confidence in the future. The Foss & Hill Machinery Co. report having sold a 3-ft. 6-in. radial drill to Warden King, Ltd., and an 18-in. lathe to the Dominion Glass Company.

The outlook in the steel trade is more encouraging of late, and it is doubtful if present low prices can persist much longer. In fact in the United States prices are already being gradually advanced and a corresponding movement in Canada may be looked for shortly. Good orders are now being placed for sheets by manufacturers of roofing materials, the orders being based for the most part on a year's requirements.

No official announcement has yet been made as to the future plans of the Canada Iron Corporation, the English bondholders apparently not yet having decided upon the best course to pursue. In the meantime, the various iron foundries of the Corporation are being operated, very profitably it is said. It is quite probable that an effort will be made to sell or lease,—the latter for choice,—the blast furnaces and mines.

The metal market continues quiet, though the demand for pig iron is fair. Purchasers, however, are merely buying for immediate requirements.

Toronto, Ont., Feb. 10, 1914.—What was said last week about the steel market would almost bear repeating this week, and still be true of conditions here. Apparently the market recovery is going to be very gradual, and dependent industries, like that of machine tools, will have some time to wait ere the awakening reaches them.

The chief topic among everybody connected with the steel industry is the statement of E. L. Cousins, chief engineer of the Harbor Commission, to the effect that a large American steel concern was negotiating for a ninety-acre site in the new area being opened for industrial purposes at Ashbridge's Bay. Mr. Cousins stated that he was unable at present to give the name of the steel company.

Several prominent steel men in the city claim to know the name of the firm, but are saying nothing. Others have heard nothing and are anxious to secure some information, thinking that this might be a serious competitor about to enter the Canadian field. There are some who think that too much importance is being attached to the statement; that this big steel company will probably turn out to be nothing but a drop forging plant say, or a larger-than-the-ordinary foundry, which the newspapers usually group under the one heading of "steel plant."

Steel Prices.

Prices of steel bars and shapes have not changed during the week, and the tendency is still upward. There has been no cutting in prices to speak of, and both American and Canadian steel companies have been doing a fair business. While manufacturers are not placing orders very freely, most of them are covering themselves in view of the warning given by steel makers that prices will go up this year.

The nut and bolt plant of the Steel Company of Canada, at Swansea, is being kept fairly busy with orders. Things are rather quiet, though, at this firm's rolling mills, at Belleville. The bulk of the trade is being done in finished goods, the demand for raw material not being so marked. In the city, there has been a good demand for reinforcing bars, indicating that building will most likely be good this year. There is a likelihood that Canadian makers of pig iron will raise their prices before long. The demand for screws, nails and wire is good, though it might be much better.

Machine Tools.

It is frankly admitted by leading brokers that the machine tool market has not yet shown any marked signs of recuperation. This market depends proportionately on other lines, and any dullness elsewhere is reflected in the sale of tools. The sales manager of one of the largest Canadian machine tool manufacturers, who was in Toronto this week, stated that while they have succeeded in landing some very good business during the first few weeks of the year, he did not expect a complete resumption of business in this line until the summer. On the other hand, there is a fairly brisk demand for specialties and engineering supplies, including transmission equipment, etc.

Business continues quiet in the metal market, the only feature being a jump of a cent a pound in the price of tin.

The Lumen Bearing Co., West Toronto and Buffalo, N.Y., announce that they are indefinitely retiring from the Canadian field. Their American business has developed so rapidly, and is now so large, that they deem it advisable to concentrate all their energy and attention to that end. The Canada Metal Co., Toronto, have purchased the die casting business of the Lumen Bearing Co., including die casting equipment and goodwill, as well as considerable general foundry equipment. They have also taken over the manganese bronze business of the retiring firm. Mr. Kester Barr, the Canadian manager, will remain in Toronto for a few weeks looking after the disposal of machinery, etc. The foundry will be leased. The quality of The Lumen Bearing Co. product has always been of highest quality, and it is with regret that we announce their withdrawal from Canada.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Berlin, Ont.—It is announced that the Rutenber Company, manufacturers of automobile engines, will erect a factory here in the near future.

Brantford, Ont.—The Board of Works will recommend to the council that a civic blacksmithing outfit be installed at the West Brantford quarters immediately.

Hamilton, Ont.—The Chadwick Brass Co. are negotiating for a site on or near Sherman avenue, on which they will erect a three-storey plant, with machine shop, plating rooms, etc.

Bedford, Que.—The Excelsior Needle Co., Torrington, Conn., who recently purchased the business and plant of The Carey Needle Co., here, will erect an addition to the present building.

Toronto, Ont.—The Canadian Seamless Wire Co., 88 Teraulay St., have awarded the contract for the erection of a plant on Clinton St. to J. B. Baker, Toronto.

Vancouver, B.C.—J. G. Hackel, managing director of Commercial Cars, Ltd., Luton, England, was here last week, looking for site on which to build a Canadian plant.

Peterborough, Ont. — The Canadian General Electric Co., Peterborough, Ont., is reported to be contemplating the building of electric locomotives, and will expend $150,000 for that purpose.

Port Mann, B.C.—The roundhouse being built by the C.N.R. is almost completed. The foundation of the car repair building is being laid, and its erection will be commenced in a few days.

Sault Ste. Marie, Ont.—The Algoma Steel Corporation's merchant mill commenced operations last week with a full day working force. Contracts on hand will keep them going four or five months.

Edmonton, Alta.—The Presto Heater Company of Alberta, 224 Jasper East, are making arrangements in Chicago to start operation of a plant here, for the manufacture of furnaces. J. E. Bertrand, secretary-treasurer.

Winnipeg, Man.—The plans for the new Engineering building for the University of Manitoba are in the hands of the architect. They do not include at present either a foundry, forge, or pattern-making shop.

Edmonton, Alta.—N. L. MacDonald, of the Dickson Steel & Bridge Co. has applied to the city for water. He wants to erect his buildings as soon as the city promises definitely to provide the water, and if possible the power.

Bridgeburg, Ont. — Frank Sweet, a Buffalo ironwork manufacturer, who has secured large contracts in Welland and other Canadian cities, is looking for a site for a plant in which to assemble all iron he contemplates using to fulfil his contracts.

Coquitlam, B.C.—A recent issue of the British Columbia Official Gazette announced the incorporation of the Coquitlam Brass Works. This is the company organized by a Mr. Bond, of Vancouver, who announced his intentions some time ago of erecting a large plant here.

Toronto, Ont.—Work is being rushed on the new brick and steel plant of Foundry Specialties Co., on Cherry St. A 21-year lease has been secured on the present site. A contract for a crane has been let to John T. Hepburn, Toronto. Grey iron castings will be made.

Toronto, Ont.—A plant will be built by The Clauss Shear Co., Ltd., for the manufacture of shears, scissors, razors, manicure articles, etc. Among the chief shareholders are John H. Clauss, Toledo, O., and John and Henry Becker, Cleveland. A charter has been secured for Ontario.

Waterloo, Ont.—The Beam Bros. Manufacturing Co., Ltd., will erect a plant here to make threshing machines, engines, boilers and other farm implements. The firm is capitalized at $40,000. Nathaniel Beam, engineer, and Gideon Beam, Waterloo, Ont., are interested.

Oxford, N.S.—The Oxford Manufacturing Co. have added a number of new machines and new methods, thus improving the products. They find it impossible to keep pace with their orders. The Oxford Furniture Co. and Oxford Foundry & Machine Co. are both adding new machinery.

Vancouver, B.C.—J. S. McDonald, of Eau Claire, Wis., was here last wek making preparation to start an iron and steel foundry for the manufacture of gas engines and other machinery. Mr. McDonald states that raw material can be obtained here for the foundry, and the product manufactured as cheaply as in Ontario.

Toronto, Ont.—The Polson Iron Works are negotiating with the Harbor Commission for a 27-acre site on Ashbridge's Bay, on which the latter will locate their shipbuilding yards.

Toronto, Ont.—E. L. Cousins, chief engineer of the Harbor Commission, stated this week that an American steel company was negotiating for a 90-acre site on Ashbridge's Bay.

London, Ont.—Two Detroit men were in London last week conferring with P. J. Edmunds, patent attorney, concerning the establishment here of a foundry to produce a new type of grate bar. The Canada Grate and Supply Co. is the name under which the new concern will operate.

Montreal, Que.—The St. Lawrence Welding Co., Ltd., Montreal, are opening a new branch at St. Catharines, Ont., to handle shop and portable work. Their present Montreal quarters have proved too small for their rapidly-growing business, and on May 1 next they will move into more spacious premises at 138-140 Inspector Street, Montreal.

Saskatoon, Sask.—A large Scotch firm engaged in the structural iron and steel business, has written, asking if a site of from 12 to 15 acres could be obtained as a bonus, on which to build a plant, which would be the headquarters for Western Canada. The head of the firm will be in the West this spring to look into the question.

Galt, Ont. — The plant of Shurly, Dietrich, Ltd., makers of saws and iron beds, was destroyed by fire, Feb. 6. The loss is estimated at $200,000, on which there is less than $100,000 insurance. Business had begun to pick up with this company, and a large number of orders were in. These will be filled at the St. Catharines plant.

Goderich, Ont.—The American Road Machine Company, of Canada, Ltd., have prepared plans for their new plant, which they will erect at an estimated cost of $90,000. The new plant will be of concrete and steel, 400 x 70 x 30 ft., the machinery to cost $30,000. Much of the machinery in the old plant will be used. A galvanized iron goods plant will also be built later.

Vancouver, B.C.—Kenneth Morrison, who for several years conducted a nail mill at Vancouver, has organized a joint stock company, and purchased some sixteen acres of land on Lulu Island. Work will be started as soon as conditions permit on the erection of a number of buildings for the manufacture of nails and other material used by builders.

Windsor, Ont.—The Ideal Concrete Machinery Co. is preparing to erect a plant in Windsor for the manufacture of concrete machinery and other products, to cost not less than $7,000, and to be erected during the coming summer. The company has asked for certain concessions, and the ratepayers will vote on the by-law on March 3.

Napanee, Ont.—A special meeting of the town council was held in the Council Chamber on Wednesday evening, Feb. 4, to consider the inducements to be offered to Mr. Decatur representing Decbut Tools, Ltd., whose plant was burned out in Montreal a few weeks ago. The company are desirous of locating in Napanee on the land south of the canning factory, and while the matter is not definitely settled, they seem willing to accept the inducements offered by the council which do not include any cash bonus.

Montreal, Que.—At present only one department of The Canada Iron Corporation is in active operation, and that is the foundry end. Five foundries are in active operation; these are located at Hamilton, Ont., Fort William, Ont., Three Rivers, Que., St. Francis and Londonderry. The furnaces at Midland upon which so much money has been spent, are shut down, and there is no telling when they will start operating again. The foundries, it is believed, are operating at a nice profit.

Windsor, Ont.—The Dowsley Spring and Axle Co. will shortly prepare plans for the erection of a plant here, costing $15,000, to be used for the manufacture of automobile axles and other steel products. The ratepayers will vote on a by-law, March 3, authorizing the city to grant certain concessions to the company, consisting of exemption, site, etc. The Dowsley Spring and Axle Co. is connected with the Ontario Steel Products Co., Ltd., with headquarters at Gananoque.

Windsor, Ont.—Mr. Gaby, chief engineer of the Hydro-electric Commission, informed the council last week that an inventory of the distributing system of the S. W. and A. Ry. Co. had been taken, and the replacement value of the transformers and station equipment was set at $155,000. The present value was $116,500, and if the city decided to purchase the plant, an additional amount of $61,500 would be required for new transformers, meters, etc. The $155,000 did not include the generating station building.

Electrical

Brantford, Ont.—The Hydro-Electric street lamps in the eastern section of the city were turned on for the first time on Feb. 4.

MACHINE TOOL REQUIREMENTS.

Two weeks ago we gave a rough idea of the machine tools required by the Buffalo Forge Co., Montreal and Buffalo, for their new plant now being constructed at Berlin, Ont. The following is a complete detailed list of the tools required:—

1 Geared head lathe, 18 in. x 10 ft.
1 Geared head lathe, 24 in. x 10 ft.
1 36-in. x 36-in. x 10-ft. planer, 2 heads on cross rail, 1 side head.
1 24-in. chucking lathe.
1 Tapping machine, 4-in. capacity.
1 Pipe-threading machine for 1-in. pipe.
1 8-ft. squaring shear, 14-gauge capacity.
1 4-ft. squaring shear, 10-gauge capacity.
1 Throatless shear, 10-gauge capacity.
1 Gear hobber, 13-in. capacity.
1 Plain dividing head, 12-in. swing.
1 No. 2 milling machine.
1 32-in. shaping machine.
1 24-in. 4-gauge drilling machine.
1 60-in. boring mill, one turret head and one swivel head.
1 Keyseating machine, 1½-in. x 18-in. cap.
1 Centering machine, 3-in. cap.
1 Jones & Lamson type, 18 x 36 automatic.

Strathroy, Ont.—$25,000 will be spent to provide for the cost of a plant to distribute Hydro-electric power. Voting on by-law, Feb. 16.

Thorold, Ont.—The council have decided to adopt the meter system and to purchase a new generator for the establishment of an all-day service.

Havelock, Ont.—The council has decided to request the Hydro-electric Commission to send an expert here to look into the lighting and power question with a view to ascertaining the best system to adopt.

Toronto, Ont. — Work on the new Hydro-Electric transmission line between Windsor, Chatham and St. Thomas is three-fourths completed.

Brantford, Ont.—The city council have passed a by-law which authorizes the raising of $20,000 for Hydro-Electric purposes. The $20,000 is required for necessary extensions to the local plant.

Windsor, Ont.—According to a statement made by Gordon McGregor, general manager of the Ford Motor Co. of Canada, they are producing power cheaper than the Hydro.

Tilbury, Ont.—The local electric light plant in all likelihood will be purchased by the town at a valuation agreed on by Mr. Jeffrey, of the Hydro-Electric Commission, and T. C. Vickerman, owner.

Brantford, Ont.—At a special meeting of the City Council on Monday it was decided to issue debentures for $70,000 for extensions to Hydro system, especially to provide for the distribution of power through the city.

Montreal, Que.—At the recent meeting of Price Bros.' shareholders, the president stated that the installation of an additional power unit, will enable them to increase considerably the capacity of the Kenogami and Jonquiere plants.

Saskatoon, Sask. — Members of the city council recently visited Prince Albert to see if terms could be arranged for the supply of power to Saskatoon when the La Colle Falls power plant is completed. No definite decision was reached.

Beamsville, Ont.—Clinton and Beamsville are negotiating for a supply of Hydro-Electric power. A sub-station for Beamsville would cost between $2,000 and $3,000, and it would be possible to use one station for several municipalities.

Winnipeg, Man. — Sir William Mackenzie, it is announced, will visit Winnipeg this week to place before the Government a hydro-electric scheme for the benefit of the Province, and for the aid of which he desires the help of the Roblin Government.

Cobalt, Ont. — The electric plant for Dome Lake mine is expected to arrive next week, together with a special force of electricians to install it. When it is installed and ready for operation, the working force will be probably more than doubled. At present mining operations are being conducted with the steam plant, which will be kept in use until the electric plant is ready to be turned over.

Kirkland, Ont.—The Charlton-Englehart Light and Power Co. have taken steps to run a transmission line from Charlton to Swastika and Kirkland Lake. Sutcliffe & Neelands have three camps of about 25 or 30 men each, erecting the poles and the power line.

Ford, Ont.—R. T. Jeffrey, hydro-electric engineer, has recommended that the village get its supply of hydro-electric power through the Walkerville distributing station. It is planned to install a white way system along the river front, using ornamental standards.

London, Ont.—The Board of Control have decided to purchase second-hand equipment from the City of Berlin, at a figure of $1,400, to convert alternating current into direct current to supply a number of users in the business section who have motors of the latter type.

Kingston, Ont. — The Napanee River Improvement Co. has made a power offer to the Utilities Commission of Kingston. It owns property at Third Lake Depot, 35 miles from the latter city, where there are falls with a 65-foot drop, with at least 1,000 horse-power for the whole year, and 2,000 horse-power for eight months available. This power could be brought to Kingston at an expenditure of about $50,000.

Electric Lights on Trains. —In the endeavor to have the latest standard in equipment and service maintained on the Great Northern trains running from Vancouver and New Westminster to Seattle and Portland, dynamo baggage cars have now been installed on trains Nos. 270 and 273, thus making all trains between Vancouver and Portland, Ore., electric lighted throughout.

Ottawa, Ont.—W. S. Edwards & Co., Sussex St., are applying to the Government to have their charter amended so that they may manufacture electricity for heat, light and power purposes. Power will be developed on the Rideau River at Rideau Twin Falls.

Nanaimo, B.C.—The Nanaimo Electric Light and Power Co. have installed a direct connected 450 h.p. unit, supplied by James Howden & Co., Glasgow. The generator was the product of the Bruce, Peebles & Co., Edinburgh. There was also installed a six-panel switchboard, a Stillwell heater, and a Worthington feed pump. Further equipment will be required for a service to South Nanaimo.

Toronto, Ont.—A second transmission line for the Ontario Hydro-Electric Commission has been surveyed between Dundas and Niagara Falls, and is six miles shorter than the present one. This will be constructed at once. The additional lines will be of extra heavy aluminum cable, reinforced by steel, and will be practically storm-proof. The present line from Dundas to London and St. Thomas is to be duplicated with a new extra heavy cable, which is also to be used on the new extension to Chatham and Windsor.

Granby, Que.—The electric light committee have purchased a slot meter, and, if it proves satisfactory, will have them installed throughout the town.

Hamilton, Ont.—The Hydro Board has decided on the installation of Tungsten lamps for the street lighting system in preference to arc lights, because they are cheaper.

Bury, Que.—A. H. Worby, representing the Westbury Heat, Light and Power Co., last week made the council a proposition for a franchise for twenty years to furnish light, heat and power to the municipality. A committee will look into the matter.

Ottawa, Ont.—The Inter-urban Company, Ltd., a new Toronto concern, with the names of the incorporators nominally given as clerks in a Toronto legal office usually associated with Mackenzie & Mann enterprises, has been Federally incorporated, with a capital stock of $5,000,000. The company is empowered to deal in all kinds of bonds and debentures, to develop water powers, establish and develop lighting or power plants, and generally to carry on any kind of manufacturing or industrial enterprise.

Cobalt, Ont.—Last week, acting under instructions from M. J. O'Brien, mine-owner and contractor, Sutcliffe & Neelands, civil engineers, of New Liskeard, put men at work to get information concerning the possibility of developing the water-power on the Quinze River, near the head of Lake Timiskaming. Mr. Neelands believes that the Quinze River has power enough to develop 270,000 horse-power, and thinks this would be sufficient to electrify the T. & N. O. R. and supply heat, power and light for all the industries of Timiskaming.

Iroquois, Falls, Ont.—All the buildings of the Abitibi Pulp & Paper Co. are now under cover except the generator and power house. Work on the power building is being rushed, and this will be finished for installation of machinery so that operation can commence early in June. The main dam will be finished in March, and the storage dam at Lake Couchichong about two weeks later. The initial capacity of the power installation at Iroquois Falls will be 22,500 h.p. Some 16,500 h.p. of this total will be required for operation of the pulp mill; and when a paper plant is later installed, the entire output of the power house will be required to operate the large mill.

Wood-Working

Port Arthur, Ont.—The Bertrand-Lockhart Lumber Co. will erect a planing mill here.

Montreal, Que.—The Mount Royal Mfg. plant, 1504 Sussex street, was damaged by fire to the extent of $2,000.

Toronto, Ont.—The Board of Control have issued a permit for the re-building of Hewetson & Co.'s factory at 88 Teraulay street, which was recently destroyed by fire.

St. Thomas, Ont.—At the annual meeting of the Producer Fish Co., of Port Stanley, it was decided to form a joint stock company for the establishment of a fertilizer plant at Port Stanley.

Victoria, B.C.—E. A. Waterman, manager of Weiler Brothers, Ltd., furniture manufacturers, states that the firm will be in a position to make a start on the erection of its new building in a few months now.

Montreal, Que.—New plans are in progress for the erection of a 4-storey paint factory for the Martin-Senour Co., Ltd. W. B. McLean, architect, 204 St. James st., expects to call tenders about March 1st.

Montreal, Que.—Twelve hundred dollars is the estimated damage done at the sash and door factory of A. Allard at the corner of Girard street and Fifth avenue, Maisonneuve, by a fire which broke out on Feb. 3.

Hamilton, Ont.—The Motor Transport Co. will be in the market for heavy tonnage motor trucks for general hauling business, contractors' material, and other heavy work. Apply to the Industrial Commissioner, City Hall.

Stratford, Ont.—The Stratford Mfg. Co. proposes to enlarge its plant and make ladders of various kinds. The company asks fixed assessment of $7,500, and permission to close part of College street.

Brampton, Ont.—The Copeland-Chatterson Co., manufacturers of business systems, have communicated with the council asking for certain exemptions and considerations in view of the proposed enlargement of its factory.

Exshaw, Alta.—At the Canada Cement Co. Plant No. 12, a fire occurred last week which destroyed the old stock house, shipping house and sack-cleaning department. This fire will necessitate closing of the plant meantime. Plant No. 10, at Calgary, which was closed, will be started immediately, and will be

kept in operation until such time as the plant at Exshaw is again operating. The buildings destroyed were covered by insurance.

Hamilton, Ont.—Tenders are asked for the erection of a new four-storey warehouse at Montreal for Tucketts, Ltd. Stewart & Witton, Hamilton, are the architects.

Toronto, Ont.—The Canadian Kodak Co. are making tests on their property near the C.P.R. tracks at Mount Dennis. It is proposed to erect a $150,000 building in the spring.

Stratford, Ont.—John F. Morelock, of Hanover, will erect an upholstery factory, 100 x 45 feet, six storeys in height, to employ 50 hands, if Stratford will grant $2,500 for a site and fix the assessment at $7,500, for other than school tax.

Kenora, Ont.—The plup proposition has been settled and operations will be commenced early in the spring on the erection of the plant necessary including power house. Captain Machin, M.P.P., advises that the deal has been practically consummated, and that the Keewatin Lumber Co. were the purchasers.

Fredericton, N.B.—Prince Bros. & McLaughlin have recently finished the construction of a barrel stave factory at French Lake. They are at present employing 14 men and will in a short time add to their help. They are now cutting 25,000 feet of lumber per day. The new industry is run in connection with the hoop factory.

Fort Frances, Ont.—The Fort Frances Sash and Door Co. have had plans prepared for enlarging their factory on Victoria ave., making it a two-storey building. The estimated cost will be $4,000. An 80-horse-power steam boiler and a dry kiln will be installed. Other improvements will also be made.

Stratford, Ont. — Charles Deibel, of Hanover, proposes to erect a factory 150 x 50, three storeys high, with engine room and dry-kiln, for the manufacture of furniture frames. This would employ 50 hands, and in return Mr. Deibel asks a cash grant toward site of $3,500 and assessment fixed at $7,500.

Flesherton, Ont.—George Watson, of Flesherton, has purchased the water-power at Priceville from A. D. McLeod and the land in connection therewith, and will build a sash and door factory in the near future. The sum paid was $14,000. The new firm will be Watson & Son.

New Incorporations

Beaver-Acetylene Co., Ltd., has been incorporated at Toronto, with $40,000 capital, to make gas appliances at Toronto and to acquire a certain patent. John J. McCarthy and Wm. H. Kahrs, Toronto, are incorporators.

Geo. Gale & Sons, Ltd., incorporated at Ottawa, capital $500,000, to engage in the business of manufacturing beds and cots of all kinds, at Waterville, Que. Incorporators: Edgar R. Parkins, Alexander C. Calder, etc., Montreal.

The Keystone Electric Co., Ltd., incorporated at Ottawa, capital $75,000, to manufacture automobiles, boats, motor boats, motor vehicles, cycles, bicycles, tricycles, motors, engines, gasoline and gas engines, steam engines, boilers, electric motors, dynamos and equipment therefor, electrical appliances, apparatus, machinery and instruments of all kinds appertaining to electrical work, at Hamilton, Ont. Incorporators: Henry A. Burbidge, John R. Marshall, etc., Hamilton.

Contracts Awarded

Toronto, Ont.—The contract has been awarded by John H. Parker, Canadian, Ltd., to McGregor & McIntyre, Ltd., of Toronto, for the steel work in connection with the construction of the Methodist Book and Publishing Co., Toronto.

Montreal, Que.— The Hollinger Gold Mines, Ltd., have placed an order with Fraser & Chalmers, Ltd., of Montreal, for an electrically-driven air compressor, with capacity of 4,500 cubic feet per minute at 100 pounds pressure.

Athabasca, Alta.—John Russell, E. H. Marstellar, and John Ritchie have secured a contract from the Hudson's Bay Co. to build one hundred and twenty scows for the coming season's river traffic.

Tenders

Kerrobert, Sask.—Sealed tenders will be received by the secretary-treasurer until 2 p.m., on Saturday, February 28th, 1914, for the following works:—Contract A—Laying water-mains, (approximately three miles); Contract B—Pump House; Contract C1—Steel Water Tower; Contract C2—Foundation of Water Tower; Contract C3—Housing of Steel Water Tower; Contract D—Water Pipes and Specials; Contract E—Valves and Hydrants; Contract G—Pumping Machinery; Contract I—Well and Galleries. Chipman & Power, consulting engineers, Winnipeg and Toronto.

Outremont, Que.—Tenders are invited for the supply and delivery at the Corporation Yard, Outremont, of the following:—87,000 feet (approximately) of No. 8 B & S. single armored cable; 21,000 feet (approximately) of No. 8 B. & S. Duplex armored cable; 9,000 feet (approximately) of No. 8 B. & S. Duplex lead sheathed cable. Cables to be for 6,500 volt, working voltage. Price to be given per foot, including delivery. Additional price to be also given per joint, for splicing. Cables must be delivered within ten (10) weeks from placing of order. E. T. Sampson, secretary-treasurer.

Building Notes

Windsor, Ont. — The Windsor Hotel Co. will start on the erection in Windsor of a modern eight-storey fireproof hotel, costing $350,000, including the site.

Calgary, Alta.—A theatre to cost in building alone $200,000, is to be constructed on Eighth avenue, east of the Dominion Bank building, for the Starland Amusement Co., operating in Winnipeg and many cities of the United States.

Refrigeration

Brantford, Ont.—The Brantford Ice Co. will shortly build a new plant, and manufacture artificial ice.

Galt, Ont.—The town council has before it a proposition to install a municipal ice-making plant in connection with the waterworks system. They discussed a communication from a Montreal firm of ice-making machinery manufacturers.

Regina, Sask.—A number of prominent business men, with the backing of the Regina Board of Trade, are advocating the establishment of a municipal abattoir, with which may be connected a storage plant, curing house for hides, tannery, etc.

Edmonton, Alta.—The Triumph Ice Machine Co., Cincinnati, have just secured the contract for the refrigeration plant at the McDonald Hotel of the Grand Trunk Pacific Railway. The principal equipment will consist of two 20-ton steam-driven ammonia compressors.

St. Thomas, Ont.—The St. Thomas Packing Co. are making arrangements to install an ice-making plant in connection with their factory. This will necessitate the erection of a two-storey addition—70 x 30 feet, to their local plant for the purpose of holding the tanks and to provide storage capacity. The company have the machinery for ice-making at the present time.

Windsor, Ont.—Mr. Fitz Bridges announces that he intends to use the site of his roller skating rink for an artificial ice plant.

Montreal, Que.—The Melchers Gin & Spirits Distillery Co., Ltd., Montreal, is enlarging its Berthierville distillery. Amongst other equipment, a Vilter 50-ton electrically-driven ammonia compression plant is to be put in. This will operate on the compound water cooling system. The work is in charge of Mr. Chas. Bishop, consulting engineer, Montreal.

Ottawa, Ont.—Work is to be commenced in the spring on a new artificial rink. Ted Dey, manager of the Arena on Laurier avenue, it is stated, will construct the new rink, which will have a seating capacity of 12,000. The Ottawa Artificial Ice Co., of which Frank Ahearn is vice-president, will, it is stated, manufacture ice in the rink, and during the winter months Mr. Dey will rent it from the Ice Company for skating and hockey. The Ice Company will make ice in the summer for its customers.

Toronto, Ont.—Cold storage facilities in connection with the new civic abattoir were decided upon last Monday. A request was sent to the Board of Control to call for tenders for the construction of a plant. Commissioner Chisholm presented an estimate provided by the contractor building the abattoir, who wrote that about $36,000 would cover the installation of three freezing-rooms, at zero temperature, on the first floor of the abattoir, the remainder of the flat to be fitted up for storage with a temperature of 35 degrees Fahrenheit.

General Industrial

Montreal, Que.—A fire last week destroyed the stock and machinery of the Merchants' Clothing Co.

Oxford, N.S..—A brick company is being organized and will commence manufacturing in the early spring.

Elora, Ont.—On February 8, a fire broke out in the factory of the Elora Textile Co. Damage to the extent of $3,500 was done.

Granby, Que.—The insurance on the Laundry building and machinery, recently destroyed by fire, was $3,850. The loss was estimated at $4,500.

Vancouver B.,C.—Last week the Restmore Manufacturing Co. took out a special permit to amend the plans of their factory, calling for a further expenditure of $7,000. The original permit was issued for a factory estimated to cost $150,000.

Saskatoon, Sask.—A large English brewery contemplates the forming of a subsidiary company here. The capital stock will be $500,000. A free site is wanted.

Rock Island, Que.—A company has been incorporated to take over the business of the J. B. Goodhue Co. makers of overalls, Rock Island, Que. The new concern, which will retain the firm name, is capitalized at $100,000.

Welland, Ont.—An application is being made to Parliament for the incorporation of the Ontario Tire and Rubber Co. with a capitalization of $750,000. The company will put up a plant in Welland for the manufacture of automobile tires.

Caledonia, Ont.—The Laurentia Milk Co., which lost its plant here by fire a few weeks ago, have decided to rebuild on the site of the destroyed plant, and will start operations at once. The new building will be two storeys, and will be an improvement on the old building.

Fort William, Ont.—Providing that the stock sales of the Grain Growers' Co. come up to expectations, another big flour mill will be erected in Fort William almost immediately. New capital is to be used in the erection of 100 elevators in the interior, and for the flour mills at Fort William and Medicine Hat.

Fort Erie, Ont.—The International Novelty Co. has been organized to manufacture pennants and novelties. C. DeMar, Buffalo, is one of the directors. A lot, 100x50 ft., will be purchased, on which will be erected a plant 35x80 ft. Sixteen sewing machines will be installed and about twenty-five hands employed.

Montreal, Que.—It is now proposed to extend the scope of the Abitibi Pulp and Paper Co., and to proceed with the construction of a four-machine news plant of approximately 220 tons daily capacity, a sulphite mill of 60 tons capacity, and to bring the capacity of the present ground wood mill up to 225 tons per day. A new company, with larger capitalization, will be formed.

Calgary, Alta.—Another step in the direction of establishing the industrial building for the accommodation of small manufacturers in Calgary was taken at a meeting of the railway and new industries committees of the city council last week, when that body decided to recommend to the city council that the purchase of the site offered by the Berkinshaw syndicate on Tenth avenue, between Seventh and Eighth streets west, for $27.000 be completed, and that the city commissioners be instructed to arrange as soon as possible for the excavation of the basement. Plans for the building will be drawn under the supervision of City Engineer Craig.

Edmonton, Alta.—The Shoe and Leather Co. has erected buildings at a cost of $33,000. The machinery and equipment cost $6,811. There are 40 vats installed, and 18 more provided for. Nine men are at work, while if they have the water, at least 50 can be employed. The shoe factory will have 25 hands, and in the harness factory, which they intend starting, 25 to 50 men will be given work. W. G. Congdon has agreed to employ, within the year, 75 hands if water be supplied.

Calgary, Alta.—It is stated on good authority that the Lake of the Woods Milling Co. has secured a site in Calgary on which they will shortly erect a mill. It announced that the Western Canada Milling Co., of Winnipeg, is about to let a contract for enlarging the capacity of their present mill in Calgary to 1,200 barrels. The Lake of the Woods oC. will erect buildings and install machinery at a cost of $200,000 and at the start will manufacture 1,500 barrels a day.

Municipal

Sydney, N.S.—The City will shortly be in the market for cast iron pipe for extensions to waterworks.

New Westminster, B.C.—The city has made plans for a municipal gas plant, and has a price put on a site.

Edmonton, Alta. — A campaign has been organized with a view to raising $50.000 to finance the undertaking of boring for gas in the Vegreville district.

Brantford, Ont. — Brantford ratepayers will be called upon to vote on a by-law to raise $100,000 for further improvements to the waterworks plant.

Westmount, Que. — The city council last week decided to sell the land bought for a fire station and town hall by the last council at the corner of Lansdowne avenue and Sherbrooke street for $30,000.

Nipigon, Ont.—A chemical machine is to be purchased in the near future by the town. It will, in all probability, be of the type that has two tanks, each capable of holding forty gallons of water.

Chatham, Ont.—The Union Natural Gas Co. will shortly start work laying a 10-inch gas line from the fields in Tilbury East and Romney Townships to Windsor. The company has a 10-inch line at present.

IF IT'S MACHINERY WRITE "WILLIAMS"

The A. R. Williams Machinery Co., Ltd., 64-66 Front St. W., Toronto

New Toronto, Ont.—If the ratepayers approve, $27,000 will be spent to provide for a water and filtration system.

Lethbridge, Alta.—It is likely the capital estimates to be tabled by Commissioner Grace will contain an appropriation of about $15,000 for the installation of meters on all water connections in the city.

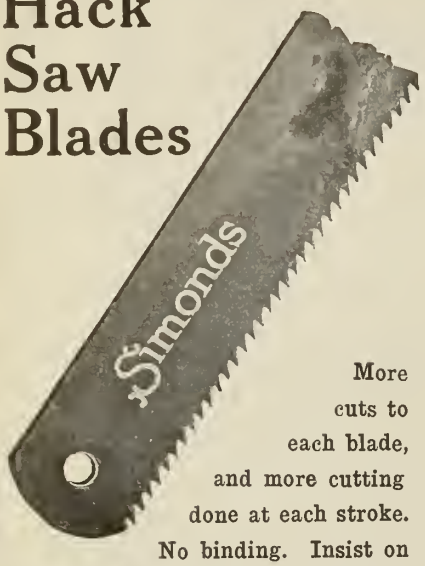
New Glasgow, N.S.—New Glasgow is mapping out an extensive programme for civic expansion during this year. Permanent street paving, sewer and water extensions, and other expenditures to meet the town's material growth, will be proceeded with.

Winnipeg, Man.—City Engineer Ruttan has recommended to the fire, water, light and power committee that the steel pipe which now extends from well 10 to near well 28 be continued to a point close to Popular Springs, a distance of 25,080 feet.

Ottawa, Ont. — The staff in the new Welland Canal office have had plans prepared for a pipe line to run from Port Colborne to St. Catharines, and work is at present in hand for preparing estimates of excavation and materials. It is likely that in a short time a definite proposal will be submitted.

Richmond, Que.—At a recent meeting of the council for the municipality of Melbourne and Brompton Gore, it was agreed to purchase from the International Harvester Co. a macadamizing outfit for the sum of $6,500.

Edmonton, Alta.—Several new industries in the Manchester subdivision have applied for a water supply. Commissioner Chalmers says it would cost about $23,000 to construct a water line to the city limits, and the concerns would have to assure the city of a revenue of $75 per month.



Ingersoll, Ont.—At a meeting of the Ingersoll Gas Light Company, held Feb. 4, it was decided that, if the company could secure concessions from the council which they desire, they would be ready this week to commence operations to have the gas delivered here as soon as possible.

Ottawa, Ont.—Judge Latchford on Feb. 7, granted on injunction against the city's proceeding further with Sir Alex Binnie's scheme to bring water from the Gatineau Lakes. The by-law had already been quashed by Mr. Justice Lennox, but the Board of Control on February 3rd opened tenders for the pipe line contract. The latest injunction declares the scheme illegal, and prevents the award of contracts, pending trial of the injunction.

St. Thomas, Ont.—Providing that pipe can be secured at the same price as that supplied last year, it will be purchased, and the extension of the 6-inch main on Elm Street to the hydrant at the Packing House will be proceeded with; also the extension on Myrtle Street. The four-inch main on Moore Street from Wellington to McIntyre Street will be torn up and replaced by a new six-inch main. Tenders will be asked for twenty-three hydrants from manufacturers of Ludlow or Holly hydrants, according to specifications to be prepared by the engineer.

Sydney, N.S. — Work will be commenced at once to connect Middle and Dumeresq lakes with the city water supply. The city council will call tenders for 11,000 feet of twenty-four-inch pipe and for the clearing of a road and pipe line right-of-way to the lakes. The storage capacity of Middle Lake is estimated at 191,500,000 gallons which would it is estimated, maintain a daily supply of about 6,000,000 gallons in addition to thepresent rate of consumption. The engineer recommends the installation of centrifugal pumps; two units of 3,000,-

000 capacity each, to be either operated by electric motor or oil engine. The total estimated cost is $87,000.

Railways—Bridges

Fitzroy Township, Ont. — A by-law providing $20,000 for the construction of bridges was passed by the council.

Guelph, Ont.—This city's share of the Guelph Junction Railway earnings in 1913 is $42,000. This compares with $34,850 in 1912.

Kingston, Ont.—The Canadian Northern Rly. will probably place a gas-electric train on its line from Harrowsmith to Kingston.

Moose Jaw, Sask.—An issue of $50,000 of new stock of the Moose Jaw Street Railway has been issued for extensions and improvements.

Regina, Sask.—The city council has under consideration the construction of an additional 10 miles of street railway, at an estimated cost of $250,000.

Walkerton, Ont.—A committee of the town council has been appointed to meet the county council to discuss the advisability of widening the two steel bridges.

Tillsonburg, Ont.—The Tillsonburg Electric Car Co., received an order a few days ago for the construction of six single truck passenger cars for the St. John, N.B., Street Railway.

Ottawa, Ont. — Twenty new double truck cars for the Ottawa Electric Railway have been contracted for. These will be turned out as fast as possible by the Ottawa Car Company, Ltd.

London, Ont.—The purchase of half-a-dozen "pay-as-you-enter" street cars, possibly the double truck variety, was authorized at the annual meeting of the directors of the London Street Railway Co. last week, for delivery by August of this year.

Brantford, Ont.—An intimation was given by Manager Kellett, of the Lake Erie and Northern Railway, to the members of the Parks Board here, that when the line is completed it will be operated as both a steam and electric road.

Ottawa, Ont.—Incorporation has been granted to the Vancouver Railway and Ocean Terminal Co., which proposes to operate a double track railway from a point on the south side of False Creek, 500 feet to the east side of Main Street, thence along the south side of False Creek and Sayers Bay, 200 feet west of Blanco Road, in the municipality of Point Grey.

London, Ont.—An important project is under way to extend the now defunct Ontario West Shore Railway and unite with the London and Lake Erie line, thus providing a radial which would connect Goderich on Lake Huron with Port Stanley on Lake Erie, and serve many of the most important towns in Ontario which are intermediate points.

Stratford, Ont.—At a special meeting of the East Nissouri Council to consider the hydro-electric project through the township, it was decided to ask the Hydro-Commission to make estimates on a road to run from London, by Governor's Road to Thamesford, thence north on the Nissouri tenth line to Stratford by the Gravel road, connecting St. Mary's by a spur line and Ingersoll by a spur from Thamesford.

Winnipeg, Man.—Contracts for the erection of several important bridges in connection with the C.N.R. system have been let and will be constructed this spring and summer by Mackenzie & Mann. The contracts call for bridges over the Snaring River, at Miette and at Athabasca over the G.T.P. crossing. Work will be started immediately on the construction of the bridge over the Assiniboine River and the junction of the Red River.

Aylmer, Ont.—Tentative plans for the proposed hydro radial from London to Aylmer have been prepared, and will be sent to Aylmer shortly. There are two propositions. The first is to run on the London and Port Stanley to Westminster station, thence east to Belmont, and thence through Mapleton and Kingsmill to Aylmer, a distance of 15½ miles. The second is to run over the London and Port Stanley to St. Thomas, and then build a branch line to Aylmer.

Toronto, Ont.—A traffic expert identified with the Public Service Commission of New York was in Toronto a few days ago to advise the Ontario Railway Board as to the street railway extensions which ought to be made in the City of Toronto. It is understood that the Railway Board will suggest that the city enter into an agreement with the Toronto Railway Co. to take over, when the existing lines are acquired, any new lines which the company may build from the present time, at cost, less depreciation, and not on the "scrap iron" basis suggested in the original agreement.

Winnipeg, Man.—Orders to the value of $10,000,000 are shortly to be placed for additional rolling stock by the Canadian Northern Railway to operate its main line between Quebec and Port Arthur. Every effort will be made to have the stock delivered early in the summer, when the line will be almost

ready for operation. Orders for close upon $1,000,000 have already gone in, and includes early delivery of 12 steel first and second-class passenger coaches, 55 colonist and 13 baggage cars. The $10,000,000 order applies to locomotives, passenger coaches, dining cars, sleepers and baggage cars.

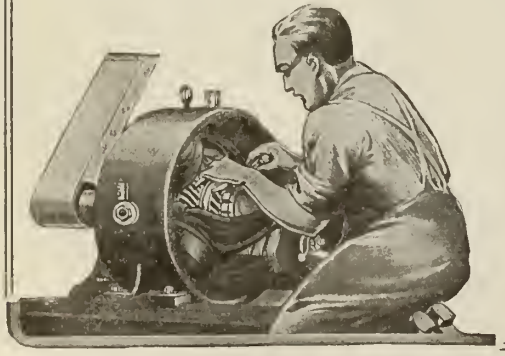
Marine

Ottawa, Ont.—Mr. Hazen has announced that the contract will, shortly be let for the new ice-breaker for the St. Lawrence.

Sault Ste. Marie, Ont.—The chief engineer of the Public Works Department has reported favorably upon the application of the Sault Ste. Marie Dock Co. for a subsidy under the act on a projected outlay of a million dollars.

Halifax, N.S.—Halifax is to have the largest dry dock in Canada, and the Public Works Department has sent down surveyors to determine the exact location. As soon as the site is fixed, the preparation of plans will be begun, and the work will proceed this year.

Ottawa, Ont.—Negotiations are in progress between the C.P.R. and the Government, looking to a greatly improved service on both the Atlantic and Pacific. It is understood that the proposition involves the construction of further new ships for both the Atlantic and Pacific, and they will have such a speed as will shorten the time necessary for the trip between Vancouver and China and Japan by several days.



The National Council of Marine Engineers elected the following officers at Kingston last week:—Grand president, L. B. Cronk, Windsor; grand vice-president, A. F. Hamelin, Montreal; grand secretary-treasurer, N. J. Morrison, St. John, N.B.; grand conductor, F. Reid, Vancouver, B.C.; grand doorkeeper, A. J. Ross, Halifax, N.S.; grand auditors, A. E. Kennedy, James Gillie, Kingston.

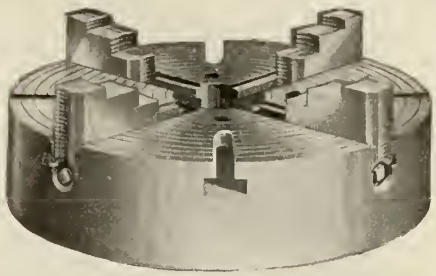
1/16 Page $1.60 per insertion on yearly order.

FUEL COST

Does Not Determine the HEATING COST

One is at the start and the other at the finish of the operation. The extent of the difference is determined by the furnace, fuel and operation employed for the purpose.



We design and build furnaces for:

CASE HARDENING — HEAT-TREATING
FORGING — MELTING
ANNEALING — ETC. — TEMPERING

Write for catalog 46.

Solve the problem of economically polishing your finished products by installing this machine in your factory.

THE
BLOUNT
No. 3.

ruggedly built to stand up against continued hard service, represents the best value in buffing machinery to be had.

It is because we have our factory equipped with many special tools and machines, because of our large output that we can build such a high-quality machine as the "Blount" at such a reasonable price.

Write for our Catalog.

J. G. BLOUNT CO.
Eve ett. Mass.,U.S.A.

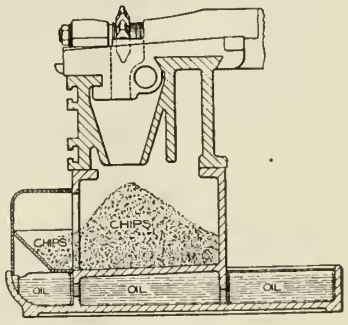
Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

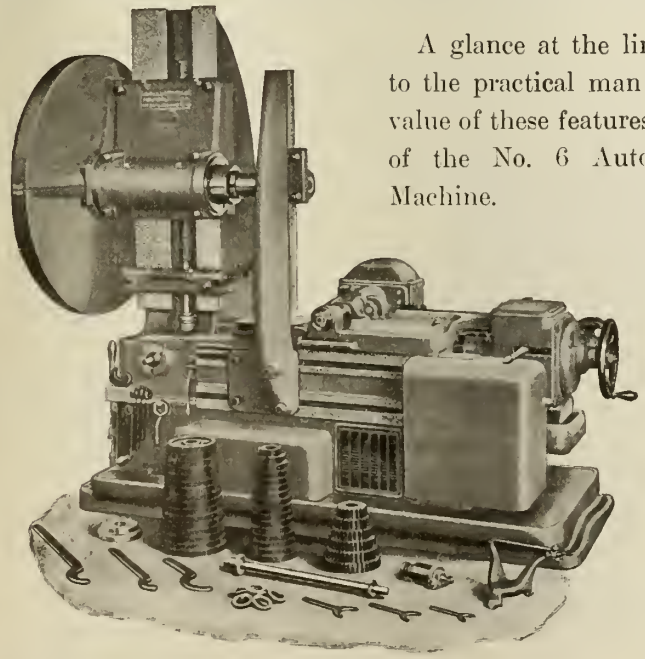
The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.





Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

Plenty of Chip Space and Large Capacity for Cutting Lubricant

A glance at the line cut tells the story to the practical man who appreciates the value of these features, embodied in design of the No. 6 Automatic Gear-Cutting Machine.

Note how the chips not only fill the large space in base but extend through to strainer at front, where all oil drains to reservoir below. From 25 to 30 gallons of lubricant can be stored in reservoirs in base, insuring a supply of cool lubricant at all times.

Observe settling basin beneath strainer.

Capacity of machine: Spur Gears to 72" diameter. Cast iron, 1¾ diametral pitch. Steel, 2 diametral pitch.

Have you carefully considered the many ways in which time and labor can be saved, and production costs correspondingly lowered, by the use of

SHELBY

Seamless Steel Tubing

In up-to-date factories and machine shops over a thousand different ways have been found of utilizing Shelby Steel Tubing to advantage. We have compiled a list of several hundreds of these, from which you could probably get some very valuable suggestions.

Shall we send you the Booklet containing this list, along with other information about Shelby Steel Tubing? Just write for it. Remember we carry the only stock of Shelby Seamless Steel Tubing in Canada—350 sizes on hand right now.

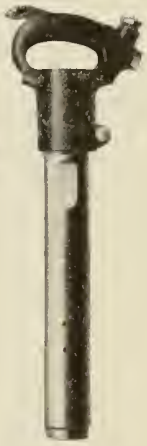
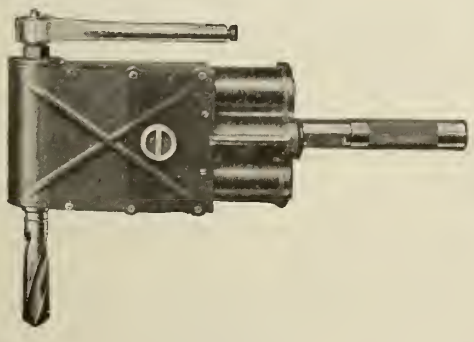
Cleveland Riveting and Chipping Hammers





Fitted with either Inside or Outside Throttle Lever as preferred. They are made in several different sizes and weights for all classes of work.

The Riveting Hammers have a range in rivets from ¼ inch to 1½ inches.

CLEVELAND CORNER DRILL For Close Quarter Drilling.

The Body of the Cleveland Corner Drill is in one piece with cylinders and valve chambers cast integral which insures absolute alignment of working parts.

The Driving Crank is mounted upon Annular Ball Bearings which reduce friction to a minimum. Made in two sizes, Nos. 38 and 49, with Nos. 3 and 4 Morse Taper Sockets.

Either size machine will drill or ream within 1⅛ inch of side wall or corner.

IN STOCK:—Sand Rammers, Bench and Floor, Portable Emery Grinders, Air Drills, etc.

BOWES AUTOMATIC AIR HOSE COUPLINGS

Over 1,000,000 in general use.

¶ They are instantly connected or disconnected.

¶ They are absolutely tight under all pressures.

¶ They are interchangeable in all sizes commonly used.

¶ They quickly pay for themselves by stopping costly leaks.

Don't Be a Commercial Explorer

¶ You haven't time to go exploring round on your own account discovering who's who in machinery and supplies.

¶ Time is too valuable these days.

¶ If you want to buy a machine or piece of equipment the easiest way is to consult this Directory.

¶ *The firms represented here are modern, reliable,* and their prices are right, and *they are already on the map.*

Use this modern guide to good buying.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

Speed-up Your Tumbling

These old-fashioned barrels are timekillers—they're wasting labor and money every day they're used. And you can't afford to keep them around—not when you can get barrels that will do the work better, cheaper and faster.

GLOBE TUMBLING BARRELS

Will do more for your tumbling room than an efficiency engineer. They will speed up the work—cut out the waste, and give you a better grade of tumbling than any other barrel. Your workmen can fill them, empty them or inspect the work without stopping the barrels for an instant. And the same barrel can be used for many kinds of tumbling by simply changing the angle at which it is running.

Globe Barrels are made in eight stock sizes—prices from $50 to $170. Our new catalog "2" is just off the press. It tells all about Globe Barrels as well as giving a lot of other tumbling information. A copy will be sent to you free, if you write us.

THE GLOBE MACHINE & STAMPING CO.
Cleveland, Ohio, U.S.A.

Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.

You Can Use a "W & B" Wrench Until You Lose It

"W & B" Wrenches are so carefully made that they can stand all the abuse incidental to hard wrench service. The jaws are tougher than the toughest nut and will hold the bite wherever there is room to hold on to the nut. This means that you can use a "W & B" Wrench until you lose it. When you buy a new "W & B" Wrench, it'll be for some new service. Select the wrench you need from our line of 58 styles and sizes.

The Bulldozer Line

MANUFACTURED BY

WILLIAMS, WHITE & CO. MOLINE, ILL.

No. 9 BULLDOZER, MOTOR DRIVEN

The BULLDOZER is a wide, roomy, long-stroke, powerful press, having ample die space for large forms. It is primarily intended for hot bending and shaping, but is also well suited for hot punching. To a less degree it is used for cold punching, bending and straightening, and much light work is produced cold on the machine.

Send us a blue print showing the work required and we shall be pleased to specify the machine best suited for the job.

Built in following sizes:

CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

MONTREAL, Eastern Townships Bank Bldg. TORONTO, 143-149 University Ave. WINNIPEG, 34 Royal Bank Bldg. LONDON, ENG., 88 Fleet St., E.C.

Vol. XI Publication Office: Toronto, February 19, 1914 No. 8

Absolute uniformity is a distinguishing feature of the **Wilt Twist Drill.** Every drill of a given number is exactly like every other drill of that number. There is no variation in hardness—in contour—in cutting quality.

Wilt Twist Drills

are made by a new process—that accomplishes at a single chucking what under old methods requires six or more separate machining operations. The hardening is done with scientific accuracy in electric furnaces.

If you are interested in a drill of super-quality, write

The Wilt Twist Drill Company of Canada, Limited

Walkerville, Ontario

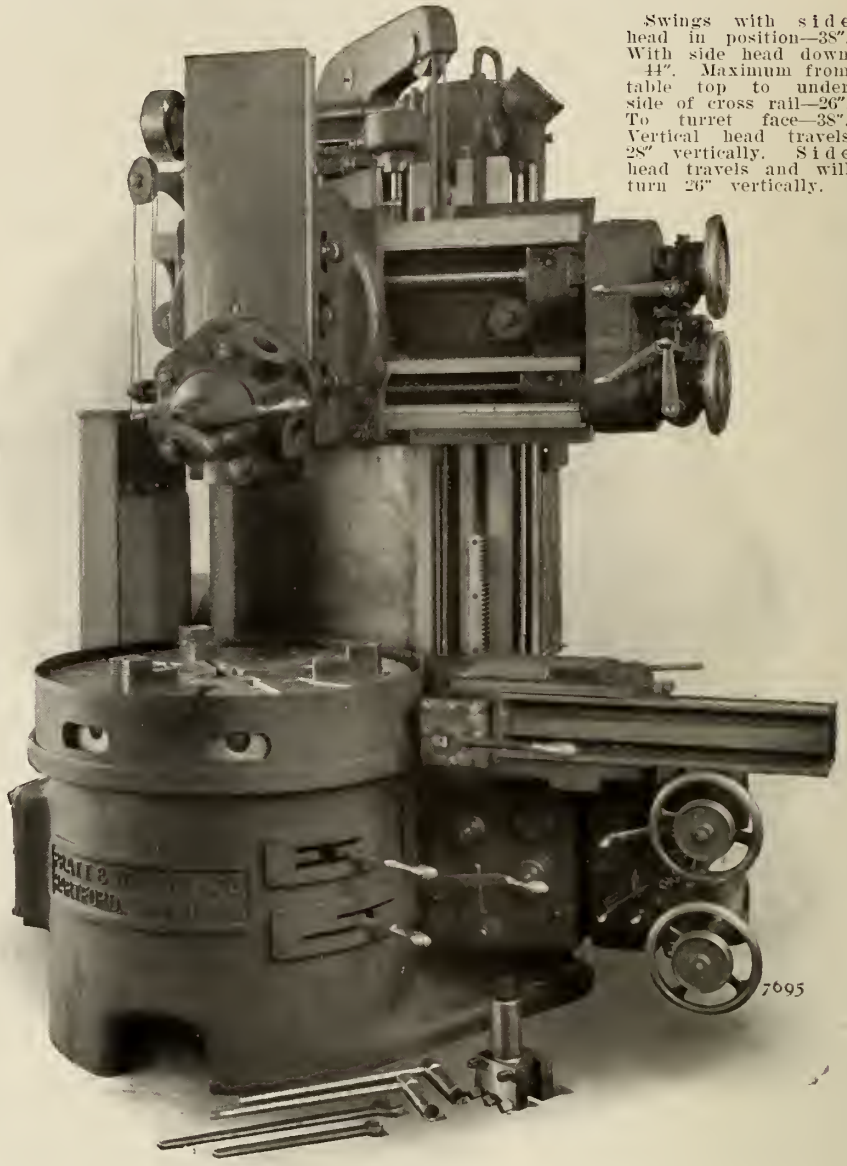
A NEW SIDE-HEAD BORING MILL

Embodies Many New and Distinctive Features

Including Independent Side Head, Power Rapid Traverse for Both Turret and Side Head and a Most Extensive System of Flood Lubrication.

Most Advanced Design in Every Detail

Every known feature for easy, convenient operation and rapid, accurate production is included.



Convenient Control

All operating levers are most conveniently located, the operator having entire control from one position. Twelve speeds are instantly obtainable, varying in geometrical progression from 3.2 to 70 R. P. M. Speed levers are located directly below the table. The lever at right of speed levers is for starting and stopping table, and when dropped to lower position acts as a brake.

In engaging feeds and power traverse, the levers are advanced in the direction which the movable member is to travel. It is impossible to injure the machine through improper manipulation of operating mechanism.

Power Rapid Traverse

in vertical and horizontal directions is provided for **both vertical and side heads.**

Swings with side head in position—38". With side head down 44". Maximum from table top to under side of cross rail—26". To turret face—38". Vertical head travels 28" vertically. Side head travels and will turn 26" vertically.

Independent Side Head

Side head is entirely independent of cross rail and can be lowered below table, enabling machine to take work up to 44 inches in diameter.

Indestructible Gearing

Table drive unit and feed units are of a new selective sliding gear type. Gears are made of alloy steel, heat treated and hardened, which, together with liberal proportions, make them practically indestructible.

Two Turret Lock Bolts

Turret indexing mechanism is of a new type in which two lock bolts are used. One bolt engages the index ring directly under the tool in operation and the other simultaneously engages the ring diametrically opposite.

Flood Lubrication

Is most extensively utilized, all feed units, table drive mechanism, cross-rail elevating mechanism, as well as spindle bearings having an ample and continuous supply of oil.

MOST POWERFUL MILLING MACHINE

(Knee Type)

GARVIN No. 22, Plain Milling Machine, Compound-Geared. Use Code, "Aperient"

The machine shown is the most powerful Knee Type Milling Machine manufactured by us, having Compound Back Gearing whose ratio is 10 to 1, through steel gears. It will transmit 10 horsepower to 14-inch cutters, running 20 revolutions on steel castings. The machine has a wide-faced pulley of 11 inches in diameter, running loose on the spindle. The power is taken from the countershaft by a 6-inch double belt to this pulley and double-backed-geared back to the spindle. The machine has an arbor 2 inches in diameter, solid, with spindle, thus avoiding a lot of arbor troubles.

DIMENSIONS

Length of automatic feed of table	28 in.
Dimensions inside of oil pockets	43½x9 in.
Vertical adjustment	15½ in.
In and out adjustment	7 in.
Crated weight	3250 lbs.

'Eliminate the Failure and the Professional Idler.'

¶ No man or woman should be permitted to grow to manhood or womanhood without being able to do something intelligently that the world wants done; without being sufficiently skilled to earn a respectable living and enjoy the better and finer things of life.

¶ No man or woman should be permitted to grow up into middle life without an occupation, without a trade, without a training along a certain line, or without a profession. This is a problem that should be handled by the state and the nation working in conjunction; and training schools should be established and factories should be erected for the purpose of bringing about this end.

¶ This is a very simple proposition and to any of us who have an inquiring mind the idea occurs logically and naturally. It is so simple, in fact, and so evident, that no one can possibly walk around the proposition or walk away from it.

¶ The average money paid for unskilled labor is $1.50 a day. This labor is unintelligent, untrained, misdirected and represents less than one-tenth of individual efficiency. It is the labor of those who have developed neither brain nor hand; of those who have never been trained, and who have never trained themselves to do anything intelligently that the world wants done. And just here we may say that no man can develop his hand without developing his brain.

¶ The training of boys and girls, of young men and young women is the most ignorantly handled of anything connected with our modern civilization, and this ignorance is responsible for the greater part of our poverty; for the suffering and sickness that usually come from poverty and is responsible, in a very great degree, for the unhappiness and the misery that exist throughout the human family.

¶ As a nation we are supporting a vast number of battleships and along with the navy we are supporting thousands of idle men who become, by the nature of their environment, professional "do-nothings." Young men who select the navy as a vocation are not only dependent on someone else for the food they eat and for the clothes they wear, but the nature of their calling is such that they are almost entirely unfitted for any useful vocation in life.

¶ As a nation we are supporting an army of men who do not work and who do not study—an army of professional idlers. And this is, without doubt, the greatest travesty in our modern civilization—that the Government should keep an army of men either on land or sea, that produces nothing, that does nothing but consume and destroy, is the greatest mystery of our time. The policy has been handed down to us from a semi-civilized period of the world when the soldier and the priest were a burden on the peasant who toiled in the field and suffered under taxes to support them.

¶ Our battleships are out of date almost as quickly as the style of woman's dress and ready for the junk-heap. Every year millions of dollars are spent to build these steel monstrosities of idleness, and every year millions of dollars are spent to feed and clothe and transport an army of idlers. Instead of having an army of a few hundred thousand young men, we should have an army of ten million young men, and each of these men should be trained and educated by the Government to earn a living; to be useful to the Government while they are working for the Government, and at the same time fit themselves to do skilfully and intelligently something the world wants done when they grow up to manhood.

¶ A half hour each day is enough time to devote to the routine of military training. That a young man should be paid by the Government to parade around covered with brass buttons and braid instead of producing something useful for the Government and for himself is a crime against taxpayers; against the man who is lured into this life of idleness.

¶ How long will it be, I wonder, until we develop a race of thinking men and women—a race of individuals intelligent enough to do away with this organized "Army of Parasites?"

Efficiency

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Development, Application and Testing of Pneumatic Tools-I*

By H. I. Brackenbury

Pneumatic appliances and apparatus adapted to one or more stages in the manufacture of mechanical and general industrial products determine by their installation in a plant, just to what extent the management of the latter are keeping pace with the progress and development being made in this particular sphere. Applied compressed air claims equal classification with electricity in the revolutionizing of manufacturing methods.

THE pneumatic hammer, reduced to its lowest terms is a combination of a cylinder, recipocrating piston, a valve controlling the flow of motive fluid to and from the cylinder, and a throttle-valve in the supply-pipe. Considered in this light, credit must be given to James Watt, Savery and others as the original inventors. All the earlier engines were designed to produce rotary motion or to work pumps with or without crank and flywheel, but the idea of using a free piston was first suggested as a good means of rock-drilling.

The Low Invention.

Amongst the earliest inventors in this field was George Low, an Englishman, who in 1865 patented a rock-drill having a hammering piston. He states in the specification that his device can be used for riveting, etc., but it was in no sense of the word a hand tool. Low is perhaps chiefly interesting as being the first to show a grasping-handle with manually-operated throttle-valve within the control of the operator's fingers.

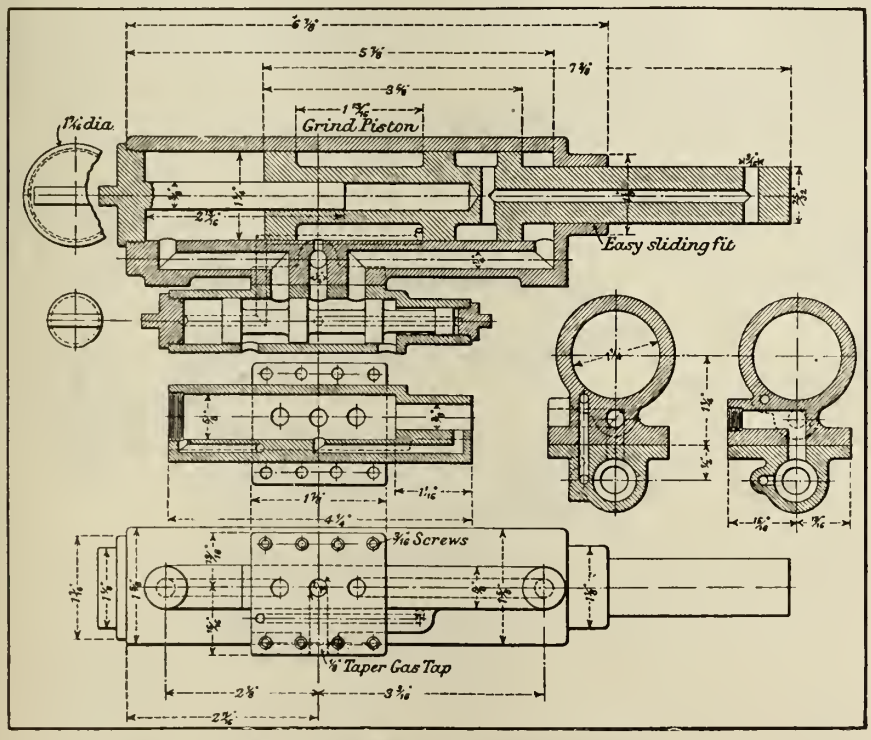

FIG. 1. DOERING'S ROCK DRILL, 1867.

The Doering Invention.

Low was followed two years later by Doering, another Englishman, with a rock-drill which shows originality of design (see Fig. 1). He was the first to patent a pressure-operated valve for this class of machine, in which the piston and valve are mutually interdependent for their respective motions; that is, the valve controls the motion of the piston, and the piston performs the double function of striking the blow and acting as a valve to control the motion of the valve itself, a principle which, in many forms and modifications, is used in all modern pneumatic hammers. A working model of Doering's machine has been made and used for demonstrating various points in patent litigation concerning pneumatic hammers.

Dennis Hand Pneumatic Hammer.

The first to patent a hand pneumatic hammer, Fig. 2, was Dr. S. W. Dennis, a San Francisco dentist, who was granted a patent in 1877 for a pneumatic dental mallet—United States patent No. 195, 102. This tool had a valve which controlled the admission and exhaust of the compressed air to and from one end of the cylinder only. The piston in moving outward to strike its blow compressed a spring which, after exhaust took place, reset the piston for the next working stroke. The compressed air was supplied by a small foot-power compressor. This device did not come into general use. Dr. Dennis's patent seems to have been chiefly utilized for the purpose of proving that some of the claims of later inventors in this field were not nearly as original as they tried to make out.

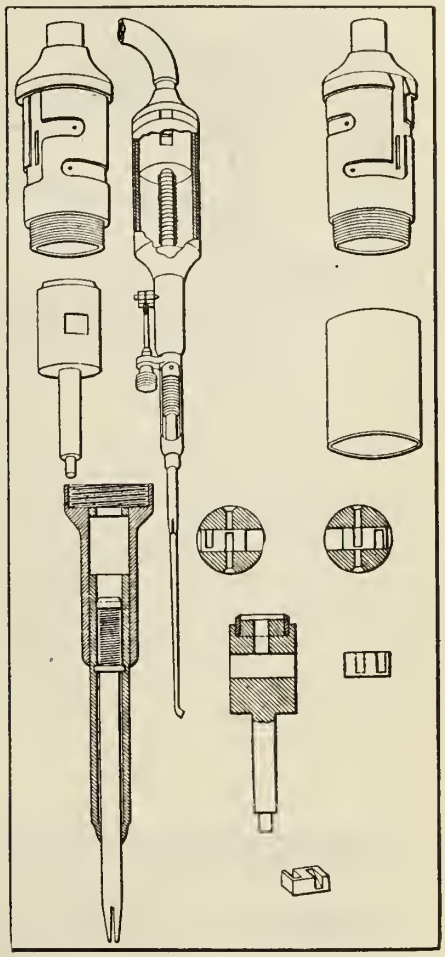

FIG. 2. DENNIS DENTAL MALLET, 1877.

Boyer Pneumatic Hammer.

The first serious attempt to produce a practical metal-working pneumatic hammer seems to have been made by Boyer, of St. Louis, who, in 1883, patented a "chipping-machine" provided with a grasping-handle and a throttle-valve controlled by hand, Fig. 3. In principle, Boyer appears to have followed somewhat the lines of Dr. Dennis.

*From a paper read recently before the Coventry Engineering Society.

Instead of using a spring for resetting the piston, Boyer used a piston of two diameters, and, under the shoulder so provided, used constant air pressure on a small area for this purpose. The piston, in its working stroke, therefore, operated against this constant pressure, tending to hold it in its rearward position. The valve in Boyer's first device was thrown backward and forward by means of a stud projecting laterally from the piston engaging a slotted extension of the valve-stem. The valve was placed in a chamber close alongside the cylinder and parallel to it. Nothing came of this device, and Boyer seems to have done nothing further in this field for about twelve years or more.

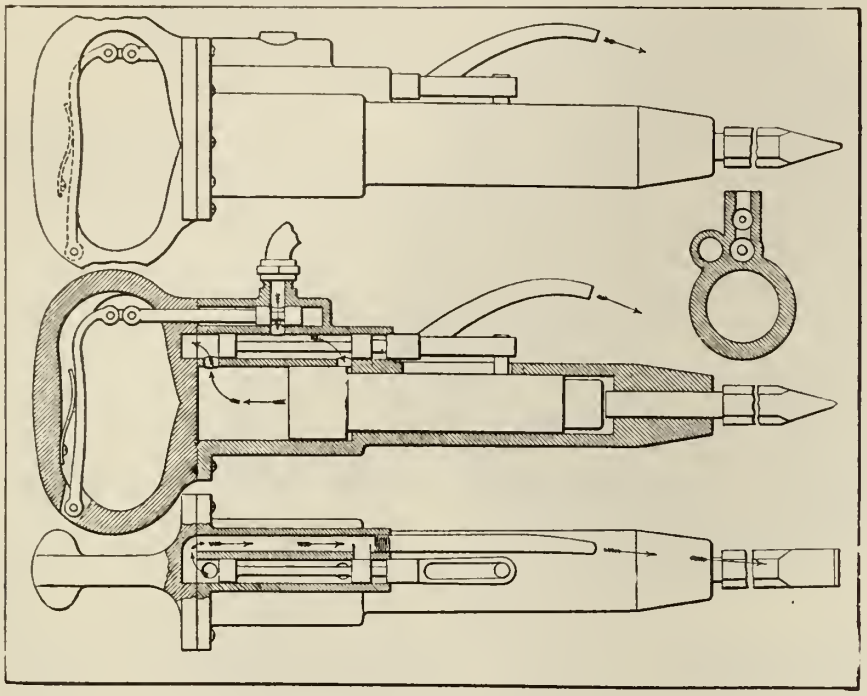

FIG. 3. BOYER'S CHIPPING MACHINE, 1883.

Brazelle Invention.

We now come to the invention of Benjamin Brazelle, also of St. Louis, who in the early eighties obtained a patent in the United States for a steam-pump, Fig. 4, disclosing a differential-area piston attached to a pump-plunger, together with a differential-area valve, each of which served to control the operation of the other. Brazelle's device is not very different from Doering's, but by using a differential-area piston in connection with a differential-area valve the construction is in consequence simpler than that of Doering. Brazelle states in his specification that his machine may be used not only for pumping, but for "working hammers or stamps, rock-drilling, and the like." This invention has also been successfully used in the patent courts, as an anticipation of the claims of Boyer and others in later types of pneumatic hammers.

Miscellaneous Inventions.

Boyer seems to have drawn inspiration from Brazelle's invention, for in 1896 he brought out a metal-working pneumatic hammer involving Brazelle's design, but modified to suit the conditions of chipping, caulking and riveting, Fig. 4a.

About this time other inventors had placed on the market pneumatic hammers of the valveless type which were used for stone-cutting, and in a small way for caulking ship and tank-plates. These hammers were necessarily of very short stroke, and depended for their effect upon extremely rapid blows, some of them making from 3,000 to 5,000 strokes a minute. A number of the earliest ones were used in Cramp's shipyard in 1894. They were not sold, but leased by the makers at one dollar per day.

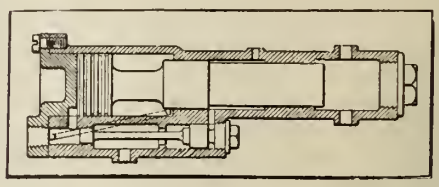

FIG. 4. BRAZELLE'S STEAM PUMP, 1883.

These tools were not provided with handles, and were not only cumbersome, but the vibration was so bad that the workmen objected to using them. Hammers of this type, of small size, are still used largely for stone-carving, being considered best for the purpose, not only in principle, but on account of low cost. Boyer was followed by Keller, Fig. 4b, Kimman, Richards, Meissner, and other American inventors, and the pneumatic-hammer industry quickly became an important one throughout the world. It was soon found that there was a large field for pneumatic hammers for closing rivets, and that the Boyer and other types of hammer, based more or less on the principle of Doering and Brazelle, and which involved the use of a piston greater in length than the length of its stroke, could not be made sufficiently

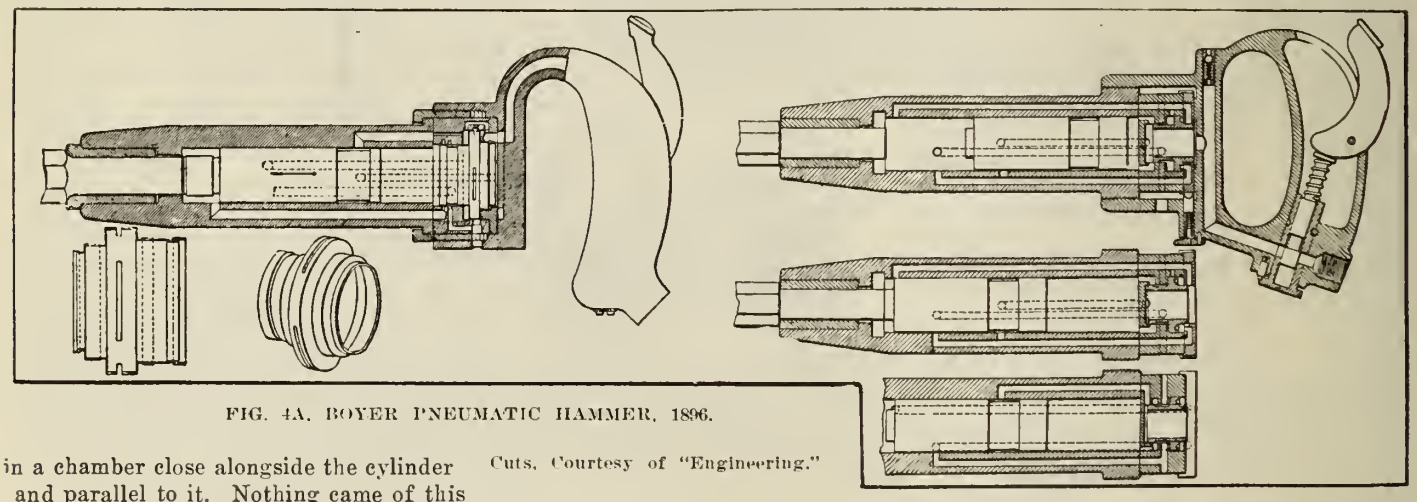

FIG. 4A. BOYER PNEUMATIC HAMMER, 1896.

Cuts, Courtesy of "Engineering."

FIG. 4B. KELLER PNEUMATIC HAMMER, 1899.

powerful to do heavy riveting without making them of such dimensions that they would be too heavy to be used by one man.

The demand for pneumatic riveters led to the invention of the "long-stroke" hammer—i.e., one in which a comparatively short piston was made to travel a distance much in excess of its own length. This was the first instance in the pneumatic-hammer art which called for original invention. Previously nearly all the so-called inventions had been largely adaptations of inventions in other fields to this particular purpose.

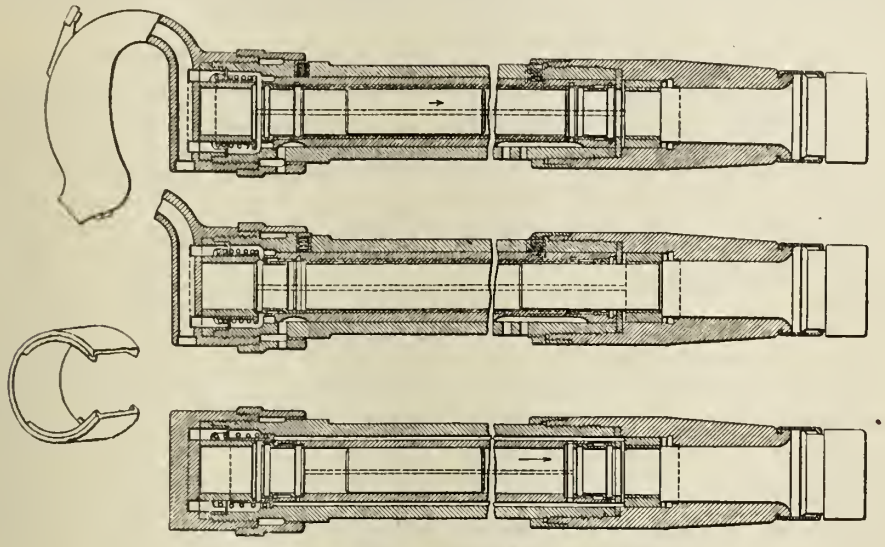

FIG. 5. BOYER LONG STROKE PNEUMATIC HAMMER, 1899.

Boyer Long-Stroke Hammer.

Boyer was probably the first to make a long-stroke hammer, and he accomplished it about 1899, by employing a valve at each end of the cylinder, connected together by two rods of small diameter placed in longitudinal passages drilled in the walls of the cylinder, Fig. 5.

The valves worked simultaneously by means of air pressure created through "cushioning" of the piston as it neared the end of its stroke. The whole was much too intricate and delicate to stand hard service, however, and was soon abandoned.

Meissner Long-Stroke Hammer.

Meissner, of St. Louis, at about the same time brought out a long-stroke hammer, with one valve only. This valve was so arranged as to be moved in one direction by live air pressure admitted to the smaller of its two differential areas, and in the other direction by pressure created by the "cushioning" of the piston on its return stroke. The design involved "throwing" the piston rearward by air pressure exerted on it through about a third of its stroke, the balance of the stroke being accomplished by its own momentum. A full stroke was assured, however, because the valve, being moved rearwardly by compression of air caused by the piston, would not shift until the full rearward stroke of the latter was accomplished.

The Meissner invention assured the success of the "long-stroke" hammer, and the main principle of his invention, which he seems to have failed to protect as broadly as he might have done, has been adopted with modifications by all the makers of pneumatic tools throughout the world.

"SAFETY FIRST."

A stationery form in use at the Sydney Mines Collieries of the Nova Scotia Steel & Coal Co. has for its heading the words "Safety First." What do the words imply? Austin King, chief inspector of mines for the H. C. Frick Co. makes answer in the Uniontown "Standard" as follows:—

"What is the meaning of "Safety First?" "Safety First," though having a sort of general or common significance to all, has for each class of officials and workmen, a special meaning which varies according to the nature of and conditions surrounding the work to be done.

To the president, it means that, as far as he is able, every provision shall be made to insure the safety of the workmen, no matter what the cost. To the general superintendent, it means anxious inquiry from superintendents and other officials—the scanning of reports daily regarding it, and the giving of many orders regarding its strict observance notwithstanding the large increase it often makes in the cost.

To the engineer it means well-considered lay-out for mines with respect to ventilation, drainage, haulage, width of barrier pillars, and the design and installation of suitable machinery and safety appliances. To the mine inspector, as its special guardian, it means much care and watchfulness, and oft-times the performance of disagreeable duties.

To the superintendent it means that he must provide supplies to insure safety in all departments and make himself as familiar as practicable with the conditions that make for safety, so as to be able, if called upon by his subordinates, to advise how best to avoid accidents.

To the mine foreman it means competent and reliable subordinates, the giving of clear-cut and unmistakable orders and directions where safety is concerned—no straddling of the question can be permitted.

The fire-boss, rib-boss and shot-firer will be made to feel that, while the faithful performance of their duty is appreciated, the higher duty of conserving life and limb is still more appreciated by their superiors.

To the miner it means that he will set that post or cross-bar, as may be required before loading the car, though it may not be ready for the driver when he calls for it. The driver will show that he understands its true meaning by not taking any forbidden risk in doing his work.

To the chief mechanic and electrician it means that they will keep the machinery, apparatus, and wiring in their charge in safe working condition; they will be sure that those they have placed in charge are sober and reliable, and they will encourage them to report promptly anything that they may notice that would lead to danger.

It means that when a fatal or serious accident happens it should be thoroughly investigated, so that the cause, if possible, may be known! and such regulations or devices, or both, as are best calculated to prevent a recurrence should be promptly made or supplied and obedience to or use of them enforced as far as possible.

Having briefly dwelt on a few of the important phases of the meaning of "Safety First," may we not ask: What would be the result if each one did his best to carry out its requirements? There can be but one answer—a very large reduction in number of fatal and serious injuries."

Largest Pelton Wheel in Switzerland.—The hydraulic plant situated on the Lontsch River in Switzerland is now using what is claimed to be the largest Pelton wheel in Europe, the wheel being of 15,000 horse-power capacity. In the same station there are already six Pelton wheels of 6,500 horse-power, so that the addition of this latest wheel brings the output of the Lontsch plant up to 54,000 horse-power, and makes it one of the largest plants in Switzerland.

Development of Chain Gearing for Power Transmission--II*

By H. T. Hildage

Chain gearing as a possible solution of the problem of furnishing an improved means of transmitting power to machines in factories and workshops is dealt with in the accompanying article, while a resume is also given of the progress made in design, manufacture and application as exemplified in modern installations.

THE rocker joint type of bearing was patented by E. F. Morse, of Trumansburg, U.S.A., in 1893. In it the idea of a pin and a journal bearing has been departed from, a knife-edge rocking on a plane being substituted, the idea being probably that if there were no rubbing there would be no friction, and consequently no wear. The sectional pins are made from cold-drawn steel bars, and hardened. Whilst the underlying idea of eliminating friction, and consequently wear, is excellent, this type of bearing has not fully realized this feature in practice. It makes a very durable type of chain, and has given very good service indeed, especially under unfavorable conditions, such as hot and dusty atmospheres, and absence of lubrication.

Liner Type Joint.

The patent was granted to J. M. Dodge, of the United States, for this type of bearing in 1904. The bearing consists of a case-hardened steel pin turning between segmental bushes, each of which is fixed in one combination of the chain. As originally made, cold-drawn strip was used for the links. This design is still in use in the United States. Later the links were placed side by side in pairs, with a view to fixing the liner in the link, and ultimately much heavier plates were used for the same purpose with much success. At the same time the shape of the holing was improved by Hans Renold, Ltd., the total effect of these improvements being to give a much more flexible chain, a greater possibility of backward bend, and a more nearly perfect attainment of the desire to fix the bush or liner in the link. It is obvious that the underlying idea of the liner-bearing is to increase the bearing area and thus retard wear. The liners are made from strip steel and case-hardened, and the pins also are case-hardened.

Comments on Foregoing Designs.

It will be readily understood that nothing like finality has yet been reached in this important part of the design of silent chains, and that this implies no question or detraction as to the suitability of present designs. In point of fact, every one of the designs above-mentioned, properly carried out, is capable of giving, and has given, a satisfactory and durable chain. Nevertheless, since the extension of pitch is really the feature, as far as the chain is concerned, that sets a limit to its life, and sets a limit also to the application of chain gearing, as regards magnitude of power transmitted, ingenuity and skill in design successfully applied at this point is sure of a reward. Improvements in the design of bearings will not only increase the durability of drives of ordinary magnitudes, but, by rendering it possible to use smaller chains to transmit the same power, will reduce the cost of the transmission.

Circular Pin Type.

The important difference between the liner type and the other types, where the pitch and width of the chain is the same, is the difference in the amount of bearing area. The bearing area can be increased in two ways: by increasing the diameter of the pin, and by increasing that portion of its length that serves as a useful bearing. With the plain link and the multiple-block type it is possible to use a pin of larger diameter than can be used in either the bush or liner type.

The multiple-block construction then is a better one than the bush construction in so far as the same proportion of the length of the pin is available to resist wear, and a larger pin can be used. On the other hand, the bearing surface available in the bush and multiple-block designs is more effective than in the multiple-link type, because the bearing surfaces are individually larger.

Again, with the plain bush type of link it is possible to use glass-hard steel bushes, and consequently to obtain a greater degree of hardness; but as an offset to this it is not possible, as in the case of the multiple-block type, to make special provision for lubrication. With the liner type of construction the whole of the length of the pin is available for bearing, and more than off-sets the diminution of the area, due to the reduction of the pin diameter. There is one weakness in it, however, and it exists also in the rocker type. In chains of these two designs it is found by experience that the extension of pitch takes place as the result of wear, not only between the pin and its bearing, but also as the result of wear between the components of the bearing and the link. This points strongly to the desirability for one element of the bearing being an absolute fixture in one combination of the chain, and in the liner type this has been substantially achieved by the use of thick links and force fits.

The Rocker Type.

The desirability of using this principle for a bearing must appeal strongly to every engineer. In addition to the difficulty mentioned in discussing the liner type, there is another, and that is, the difficulty of preveuting the rocker or knife-edge from sliding ou its plane. This sliding is quite likely, in fact, is certain to take place when the chain is under tension as well as when it is not, and it can only be prevented by fixing the rocker and the pin, not only in their respective combinations, but also by fixing them, or at any rate by reducing the clearances to a minimum, in the alternate combinatious, and as these clearances become increased by wear, the sliding again begins to occur.

The Future Outlook.

It seems probable that the type of bearing that will finally prevail will be the circular-pin type, because, as far as existing experience goes, it has certainly not given iuferior results to the other, and it does seem to have greater possibilities as regards improvement. Improvements in this type will have for their object:—

The increasing of the areas available to resist wear.

Increasing the degree of hardness of wearing surfaces.

Improving the methods of lubrication.

A very important feature of all such improvements will necessarily be simplicity.

In connection with the first-named object it can be stated that it is mechanically possible to produce a chain that will permit the use of a larger diameter pin than can be used with the liner type, and will, at the same time, permit of as great a proportion of the length of that piu being available. It remaius to overcome the manufacturing and commercial difficulties. Such a chain would also have the advantage that instead of a half of the tooth face of the chain bearing on each wheel tooth, practically the whole of it would come into play.

Tooth Form.

It is not necessary to say much more than has already been said on the subject of tooth form. The only portion of the

*From a paper read recently before the Manchester Association of Engineers.

tooth profile that is left to be fixed, when the link has been designed, is the top—i.e., the depth of tooth. The actual shape of the top of the tooth is, of course, of no consequence, but the depth is important, inasmuch as it directly affects the length of the life of the chain. This dimension will evidently be fixed at the same time as the link is designed, and will be made as great as possible, without spoiling the shape of the link.

Methods of Guiding.

There are three methods of keeping the chain on the wheels in general use:—

By flanging one of the wheels.

By a running flange in the chain, which runs in a groove on the centre of the wheel.

By running flanges on the outside edges of the chain, which overlap the edges of the wheel.

Perhaps the most generally satisfactory of these three methods, but certainly the most expensive, is the flanging of one of the wheels. Any end-play in the shafts, or defect in aligning the wheels properly, can be allowed for by making the wheel extra wide, and faults in alignment or parallelism do not lead to such rapid destruction of the chain as is usually the case with other methods of guiding. The centre guide-chain has a solid link inserted in every alternate pitch, and a groove is turned on the wheel, into which this link, or running flange as it may be called, will fit and run. This is a very cheap and satisfactory method of guiding, and is probably more generally used than any other. The objections to it are that it requires that the wheels should be carefully lined up, and the shafts made parallel, otherwise great stresses are brought to bear on the pins in the chain-bearing, and the chain is rapidly racked to pieces. A certain amount of error, of course, is of no consequence, because it is usual to allow from 0.03 in. to 0.08 in. clearance between the centre guide-plate and the groove, and, in addition to this, the chain has, after all, a certain amount of lateral flexibility. For these reasons excessive accuracy in lining up is unnecessary.

The third method of guiding, by outside flanges on the chain, has the advantage that it is cheaper than flanging the wheels, and eliminates also the expense of cutting the grooves in the wheel. There is a possibility, however, that faults in alignment may force the outside guide-plates off the pins and cause the chain to fall to pieces. This method of guiding has also the disadvantage attached to the centre guide—namely, that faults in alignment bring excessive stresses to bear on the pins and bearings, resulting in rapid wear.

Bush Roller Chain.

This type of chain was invented in the year 1880, by Mr. Hans Renold. It is so called because the bearing consists of a pin and bush knuckle-joint, with a roller running on the outside of the bush to relieve the friction between the chain and the wheel at entering and leaving. The pin is carried by one pair of side plates, and the bush by the adjacent pair, the roller running freely on the outside of the bush. The pin and bush are fixed in their respective side-plates, in order that the motion of bending will be taken up in the bearing proper, which is prepared for it.

In gearing with the chain-wheel, the teeth of the wheel pass between the side-plates of the chain and engage with the rollers. There is probably no doubt about it that, in a new chain at any rate, the action of the roller is not so much in relieving friction between the chain and wheel-teeth as in absorbing impact. It will be convenient to defer the consideration of how far this type of chain complies with the general specification until the design of the chain and wheel-tooth form have been discussed.

Roller Chain and Wheel Design.

The gearing element in this type of chain is the roller, and the link form, therefore, offers no problem to the designer, other than those connected with strength, weight, and possibly appearance. The stud must be of such diameter and length that it will give sufficient bearing area to transmit the power or pull required, efficiently. The outside diameter of the bush will, of course, have its own effect on the shape of the link head into which it is fixed. A certain amount of impact is transmitted to the bush by the roller, but the bush in its turn is well supported by the stud, so that bushes very rarely suffer on this account. The amount of bearing area between the roller and the bush is naturally not nearly so important, although necessarily rather greater than between the bush and the stud. The diameter of the roller affects the size of the teeth. An excessively large roller would give an impossibly small tooth. On the other hand, the internal diameter of the roller is fixed by the diameter of the stud, and the roller must be stout enough in thickness to resist the impact.

The bush roller-chain was originally designed for the transmission on a bicycle, and later it came into use for the rear-drive on a motor-car. As a general rule each builder of motor-cars fixed the dimensions of his own chain, and the result is that roller-chains stand very badly in need of standardization on rational lines. It has been tacitly decided by each manufacturer of roller-chains to make each of the various sizes selected at different times by different makers of motor cars, but it would require considerable stretch of the imagination to show that this series of chains can be considered in any sense a reasonable expression of the principles above enunciated.

Tooth Form.

The exact form of the wheel teeth has been the subject of careful study and experiment. The requirements are substantially the same as for silent chain-gearing—namely, that impact at entry shall be a minimum, that movement of the chain after entry, with regard to the teeth, shall also be a minimum, and that small increases in pitch of the chain, due to wear, shall not affect the fulfilment of these conditions. A good many different tooth forms have been in use with different makers at different times, but the gap that seems most nearly to fill the above requirements consists of:—

A root-circle equal to the roller diameter, or a few thousandths larger.

Two straight lines at 60 deg. to one another, forming tangents of that circle.

An arc of a circle, or circles, joining on to these tangents and forming the top of the tooth, determining its height.

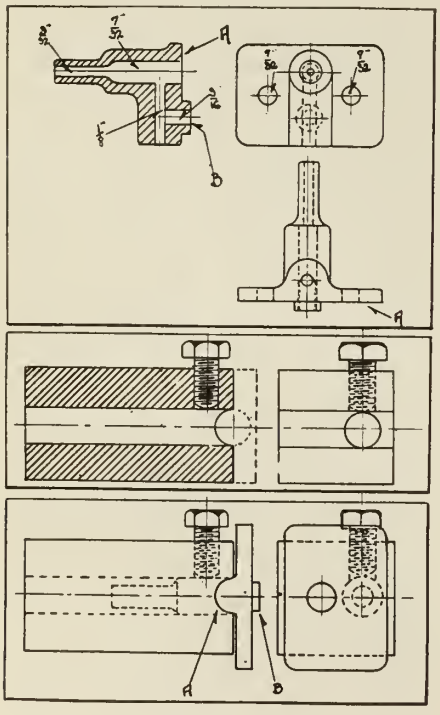
The manner in which the various parts of this form fill the requirements is as follows:—

When the chain is new and of correct pitch, the roller falls into the root-circle, and the impact is taken by a considerable portion of the circumference of the roller, also by a considerable area of the wheel. If the chain is worn somewhat, the incoming roller comes into contact with the tooth-surface at an acute angle; in other words, the incoming roller strikes it a glancing blow in the tooth of the wheel, with the result that injury to the roller or to the wheel is minimized and noise reduced.

In the action of the worn chain on the wheel, one of the rollers beds down into the root of the gap, and the others take up positions on the straight flank, which depend on the amount of extension of pitch and their distance from the roller that is bedded down. The position of the bedded-down roller depends on the relation between the tension on the slack side of the chain and the tension on the driving side, and there is consequently a certain amount of movement between the roller and the wheel teeth whilst in engagement. It is evident, however, that the bedded-down roller is at the point of least pressure between chain and wheel, and consequently this motion does not induce much friction or cause much wear. Evidently the same kind of thing occurs with the silent chain; the unimportant character of the motion is shown by the fact that very little, if any, tooth face-wear occurs in normally designed silent chain-drives. The curves which form the upper portion of the teeth are so designed that on entering and leaving, the roller does not touch them at all, but comes right in, and is lifted right out of its final position, without rolling or sliding.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.



MACHINING AN OIL-FUEL INJECTOR NOZZLE.

By G. Black.

ONE of the products of the shop with which the writer is connected is a line of oil engines operating on kerosene. These engines, which are rated at 5 h.p., are built at the rate of one hundred per week. One of their component parts is the fuel injection nozzle shown in Fig. 1. These nozzles are of gunmetal and come through the shop in batches of one thousand at a time. In order to machine them economically and expeditiously the simple fixtures here shown were made.

The first operation is to face the casting at (A) and to turn the spigot (B), Fig. 1. For this operation the fixture shown in Fig. 2 was devised. It consists of a piece of wrought iron, 1⅜ inches square by 3 inches long. Two holes were drilled through it as shown, and the portion shown in dotted lines was cut off, leaving a half-round groove at the end. The hole for the 5-16-inch set-screw was then drilled and tapped.

The fixture is held in a 4-jawed chuck, and the work to be machined is inserted as shown in Fig. 3. The set screw is then tightened slightly, and the chuck jaws are adjusted until the spigot (B) runs true. After the jaws have been correctly adjusted for the first piece, they

FIGS. 1, 2, 3. MACHINING AN OIL FUEL

are not again interfered with, succeeding pieces being inserted and held by the set screw and driven by the half-round portion which fits into the groove, as seen at (A), Fig. 3.

The first machining operation consists of a roughing cut to get under the sand

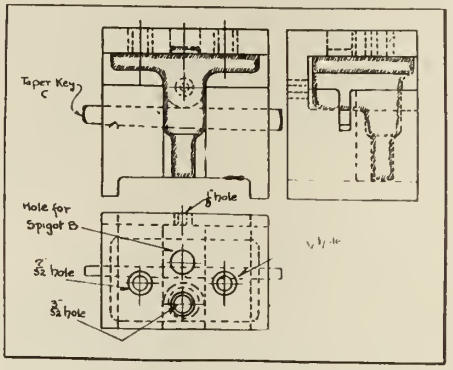


FIG. 4. MACHINING AN OIL FUEL INJECTOR NOZZLE.

skin. The turret tool holder is then reset, and a forming tool, with an ⅛-inch step in it, turns the spigot to diameter and finish-turns the face (A) and spigot (B) to depth. The tail-stock of the lathe is furnished with a drill socket carrying a 3-16-inch drill. This next comes into play and drills a hole ½-inch deep, completing the first operation, the detail times for which are as follows:—

Chuck	.25
Rough turn	.30
Re-set tool and finishing turn	.45
Re-set tool, change speed and drill hole	.50
Check work with gauge and remove	.50
Total Minutes	2.00

The succeeding operation is that of drilling the remaining holes seen in Fig. 1, and for this the simple jig shown by Fig. 4 is used. The position of the nozzle in the jig is shown by the etched lines. It is secured in place by the taper key (C). The holes are all drilled on a Ward 4-spindle drill. The first spindle is fitted with a 7-32-inch drill, the second with a 3-32 inch drill, and the third with an ⅛-inch drill, while the fourth spindle is equipped with a geared head and friction drive for tapping. The whole drilling operation takes but 1½ minutes, the detail times being as follows:—

Place piece in jig	.30
Drill three 7-32-in. holes	.45
Re-set jig and drill one 3-32-in. hole	.25
Re-set jig and drill one ⅛-in hole	.25
Remove piece from jig	.25
Total minutes	1.50

This completes the machining of the nozzle, the total time being:—

Turning	2.0
Drilling	1.5
Total minutes	3.5

The limits of tolerance allowed on the piece were .002-inch.

COUNTING SPEEDS WITHOUT A SPEED INDICATOR.

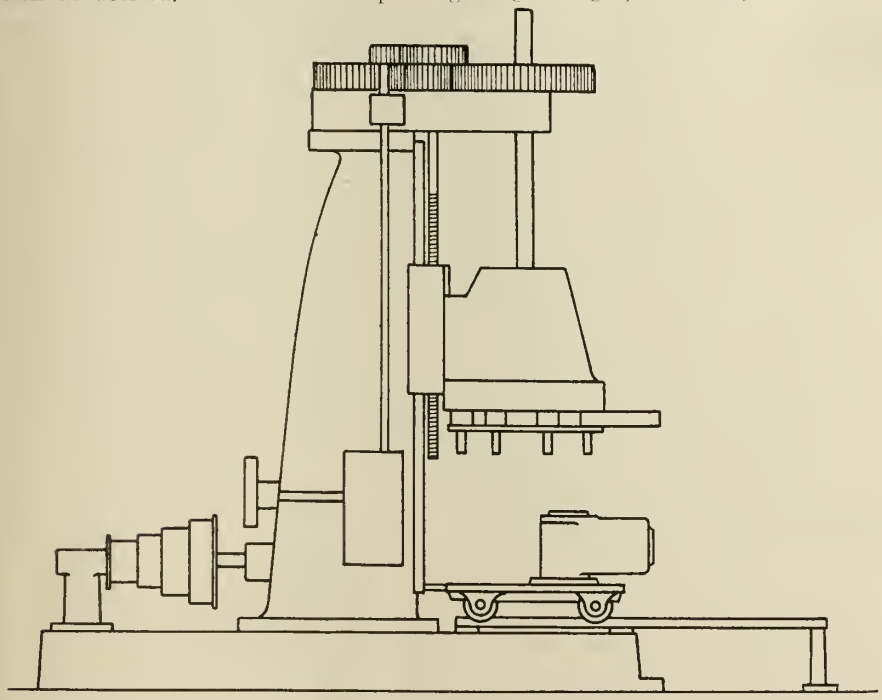
By N. G. Near.

IT is not difficult to count shaft revotions up to speeds of 500 r.p.m., or slightly more without the use of a speed indicator. Count with your fingers, as follows:—

On nearly every rotating shaft or pulley there is some projection that you may allow to touch your finger or hand every time it makes a revolution. You can distinctly feel these "touches" and you can easily count them up to ten, mentally, because most of the numbers between one and ten have only one syllable—you can, therefore, count more quickly up to and including ten than you can beyond ten. Most of the numbers beyond ten are composed of more than one syllable, hence the mental formation is slower. As soon as you reach ten in your mental counting, make note of it with your little finger, then count ten again and make note of it with your second finger, next the middle finger, and so on. As soon as you have counted a hundred, i.e., as soon as you have used all the fingers of one hand twice, catch the time on the watch and speed is easily computed.

For example, I counted 100 revolutions by use of this method in 14 seconds. The speed then equals

$$\frac{60}{14} \times 100 = 428 \text{ r.p.m.}$$



AN ADDITION TO THE MULTIPLE.

D. O. Barrett.

A CERTAIN machine shop was equipped with an 8-spindle multiple drill press. The drill head was operated vertically by means of a screw instead of

the usual rack and pinion. It was thus impossible to raise or lower it by hand. Some little time was therefore lost in throwing in the rapid traverse, and especially so if the head were raised far enough above the work to enable the operator to reach in to withdraw the work easily and without danger to himself. Orders had been issued to the operators to stop the press each time when putting in or removing work. The inertia of the heavy gears at the top, however, would keep the machine running a few moments after the belt was thrown off, and so it was most natural to leave the press running continuously. In reaching in to remove some work, one of the operators had the sleeve of his jacket caught by a drill, and before the press could be stopped was injured in such a manner as to subsequently lose the use of the hand on that side.

To avoid further trouble of a like nature, and in an effort to get more work out of the press than had hitherto been done, the carriage shown in the cut was built and used as a permanent fixture. The table of the carriage was nearly as large as the base of the press, being 30 in. x 30 in., and was mounted on four V-grooved wheels, these wheels running on steel angles with the corner turned upwards. An adjustable screw stop was provided at the back to limit its motion as desired. The table was provided with T-slots for attaching the various jigs and fixtures used.

AN ADDITION TO THE MULTIPLE.

Two men were hereafter employed on the press and considerable time was saved by this method. The carriage would be drawn back by the helper entirely clear of the press, the tracks being supported at the outer ends by standards attached to the floor. As most of the work consisted of drilling the flanges of cylinders, bases, etc., the work most common for this kind of a machine in a gas engine shop, plugs or other simple locating fixtures were attached to the table of the carriage so that the castings could be easily and quickly located by the helper. The table was also at such a height as to enable a man to easily set a casting thereon without stooping to any great extent. The helper then shoved the carriage under the press and up against the stop, having previously placed the drill jig in position on the piece.

The press operator now proceeds to the drilling, he practically taking care of but this one operation. In returning the drill head, it is only necessary to get the drills just far enough out of the work to clear the jig, when the carriage is pulled back and re-loaded. It will be seen that there is thus no locating to be done. The production of the machine was more than doubled through the use of the carriage, and the machine was left running continuously, no time being lost in stopping and starting, and there was no danger to either the operator or helper as before. Before the carriage was added, trouble was always experienced in getting the men to handle the machine as they were always afraid of getting caught, but they afterwards seemed to enjoy operating it, cutting down as it did a great deal of the laborious operation.

Were it justifiable by the amount of work the track could be placed entirely across the machine table in the opposite direction, two carriages being used as well as two helpers, one on each side of the machine. As one carriage was withdrawn, the man on the other side would shove his carriage, already loaded, under the press, and while the drilling was being down on this, the first carriage would be loading, and shoved under as the first was withdrawn. By using two carriages and two helpers, besides the regular operator, the production of the machine could be practically doubled over the arrangement here shown, as the machine could then be kept drilling almost continuously, the only limiting condition being the ability to get the work under the press fast enough.

TENSION ON CYLINDER COVER STUDS.

By A. E. W.

IN the February 5 issue of **Canadian Machinery** there appeared an article under the above heading, by J. H. Rodgers, in which the old question is raised of whether the tension in cylinder cover studs is increased when steam is admitted to the cylinder.

It is generally agreed that with a metal-to-metal joint no increase in the tension on the studs takes place until the force tending to separate the cover from the flange exceeds the initial tension in the studs due to the screwing up of the nuts. If, on the other hand, an elastic packing be inserted in the joint, the tension on the studs is equal to the initial or "screwing-up" tension, plus the tension due to the steam pressure. This second conclusion is correctly arrived at by Mr. Rodgers, and is illustrated by his Fig. 8. His Fig. 1 also shows conditions as they are, but he makes the mistake of saying that if the weight on the cover were only 10 lbs., the stress on the studs would be 1,005 lbs.

In order to secure a steam-tight joint it is, of course, necessary that the cover and flange be made thick and rigid. When the cover and flange are pressed together, metal-to-metal, they are much more unyielding than the studs or bolts. If the flange and cover are assumed to be so heavy and rigid that they cannot be compressed at all, the studs are practically springs, and, in order to produce in them a tension higher than the initial tension, a force must be applied to the cover sufficient to separate the latter from the flange.

Referring to the accompanying Fig. 1, let it be assumed that each nut is screwed up so tight that its stud is elongated 1-1000 inch, and, in order to use the same figures assumed by Mr. Rodgers, we will suppose that this elongation produces a stress of 1,000 lbs. in each stud. The cover is thus pressed upon the flange with a force of 1,000 lbs. for each stud. Only two studs, as seen

in the figure, need be considered. We have then a force of 2,000 lbs. holding the cover to the flange.

If a weight of 800 lbs., as shown at (A), be now placed on the cover, it is obvious that no extra stress is set up in the studs. For they cannot be stressed beyond 1,000 lbs. without being at the same time further elongated, and they cannot be further elongated unless we separate the cover from the flange, to do which will require a force of slightly

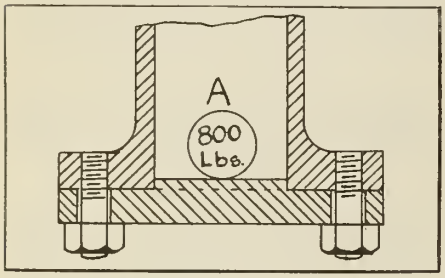


FIG. 1. TENSION ON CYLINDER COVER STUDS.

over 2,000 lbs. The only effect of the weight (A) is to reduce the pressure between the cover and the flange by 800 lbs. If, however, the weight (A) be increased to 2,000 lbs., the studs will be stretched a further 1-1000 inch, and the joint will open. This result has been embodied in the following rule:—

When the bolt, or stud, is more elastic than the material it compresses, the stress in the bolt is either the initial stress or the force applied, whichever is the greater.

The Elastic Joint.

Next consider the conditions existing when a packing or gasket is introduced at the joint, as shown at (B), Fig. 2. In such a case, it is the packing rather than the stud that is elastic. Let us assume that the studs are again stressed to 1,000 lbs. each, and that this compresses the packing 1-100 inch. If now the weight (C) of 800 lbs., as before, be applied, the studs will be stretched an inappreciable amount compared with the

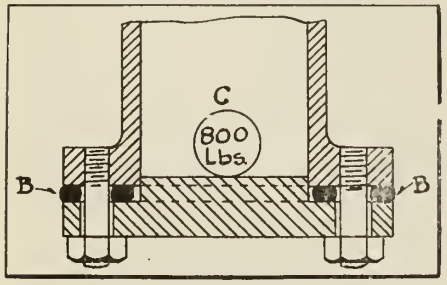

FIG. 2. TENSION ON CYLINDER COVER STUDS.

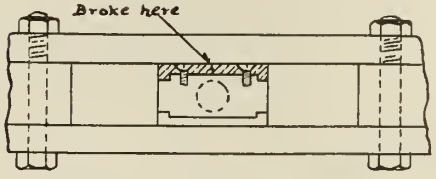
amount the packing has been compressed. The result is that the packing will be pressed against the flange with practically the same force as before, and the only effect of the weight (C) is to increase the stress in each of the studs by 400 lbs. In other words, the stress in the studs is the initial stress, plus the stress due to the force tending to seperate the cover from the flange. Hence the second rule:—



When the material compressed is more elastic than the stud, the strees in the stud is the sum of the initial stress and the force applied.

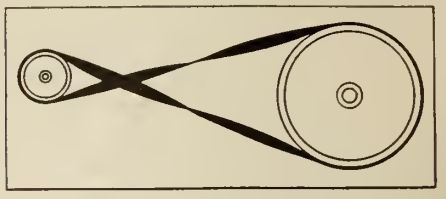
REPLACING CROSSHEAD LINER.

By R. Bell.

ON an engine of the double bar type there were brass liners fixed to each side of the crosshead shoes. These were secured by means of 5/8-in. countersunk headed screws, and further held in place by a shoulder at each end as shown in sketch. One of these liners got working loose, and eventually broke in the middle, so it had to be replaced, being unsafe. A very quick and effective repair was made as follows.

The top guide bar was taken off and the liner removed. The guide block was cleaned properly and then replaced. The engine was next turned over until the crosshead stood in the narrowest part of the guide bars, these being

REPLACING CROSSHEAD LINER.



worn a little in the centre. The open edges were then boxed up with wood and all small spaces filled with clay, provision being made for a runner to allow the babbitt to be poured in. The space formerly occupied by the liner was now filled with babbitt, boxing removed, a liberal supply of valve oil applied to the guide bar and the engine started up. The result was a first-class job started and completed during the lunch hour.

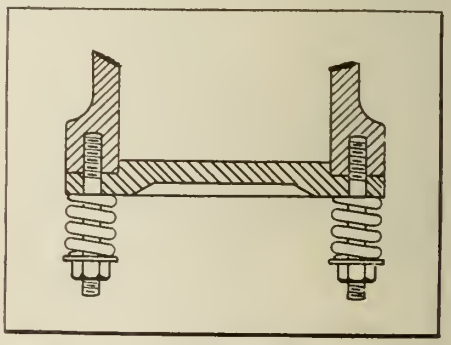
I am of the opinion that babbitt might be used more extensively than it is for repairs such as the above-mentioned. It makes a substantial and satisfactory job, does away with all machining.

RUNNING A CROSSED BELT.

By J. E. McCormack.

WHEN running a crossed belt on two pulleys, one of which is only one-third, more or less, the diameter of the larger pulley, try putting the belt on the smaller pulley first; then, after crossing it, turn the remaining loop inside out, other side to the pulley, before placing it on the latter. This belt will now scrub its edges less than if put on in the usual manner. Of course, as one side comes in side comes in contact with the other pulley the joint must be laced or fastened accordingly. The foregoing method will

RUNNING A CROSSED BELT.



not apply when the difference in the pulley diameters is comparatively small.

STRAIN ON CYLINDER HEAD STUDS.

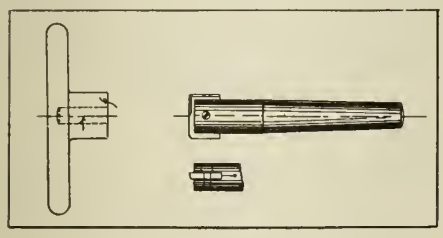
By H. Westwood.

AS this is a question about which there ought not to be any difference of opinion among engineers, and as there is some danger that some who ought to understand it, may not consider it worth their while to figure it out, I beg to submit the following explanation:—

Assume that ten studs securing a cylinder head to the cylinder are long enough to permit a heavy coil spring on each one in such a way that one end of it will press against the outside of the cylinder head, and the other end against a washer placed between it and the nut on the stud. If the nuts be now screwed up, so that each spring is under a tension of say 1,000 lbs., there will be a total pressure of 10,000 lbs. against the head tending to hold it up to the end of the cylinder. As the springs will exert an equal pressure in both directions, there must be a tension of 10,000 lbs. on the studs. It will now be readily understood that all the strain there is on the studs is that due to the action of the springs, and that this cannot be increased except by further compression of the springs. This can be done from the inside of the cylinder by turning on the steam and as soon as the pressure

STRAIN ON CYLINDER HEAD STUDS.

rises in the cylinder there is certainly more stress on the studs by further compression of the springs, thereby forcing the head away from the cylinder and shortening the distance between



the cylinder head and the washers under the units.

To those who find this proof convincing, it may be well to suggest that the part performed by the springs in this particular case is ordinarily taken by the elasticity of the studs which act precisely in the same manner, and it may be well to say further that the above action in regard to bolt strains, is not confined to cylinder head bolts only, but is true in all cases where a bolt or a stud is subjected to tensile strain.

FINISHING HAND WHEELS.

By D. A. Hampson.

ONE of our shop products was a hand-operated machine which had an adjustable guide operated by a 15-in. hand wheel of the design shown in the figure. These wheels came to us from the foundry with solid hubs. They were put in a four-jaw independent chuck, trued up, centred, drilled, bored, and the ends faced off—all in the short space of an hour apiece. Sometimes twelve were required and sometimes twenty-four, but the conditions were such that it was not advisable to make a large number of the

FINISHING HAND WHEELS.

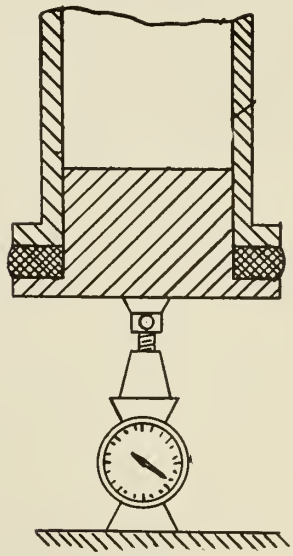
wheels at a time, and, under such conditions, it had always been considered that the resultant high cost of finishing the hand wheel was a thing that had to be endured.

I was put on the job which included among other things the finishing of these wheels, and, by dint of some hustling, managed to turn them out in an average of 45 minutes. After one lot went out, I requested permission to "tool up" a little for the next, but was informed that it wouldn't pay. In the end I was told to "see what I could do for $5."

First I took a blank casting, turned the rim and the hub, and filed it up nice and smooth. The patternmaker added a core print and made a core box to give us a cast hole ⅛ in. smaller than the machined size, and with a blind end—which was the way all the wheels were used. I was then sure that the castings would come round and that I could use a universal chuck, which would save the truing-up time.

A piece of mild steel was turned up to fit the tail-stock, and having an extended end of a length equal to the core in the hub. This end was slotted and split, and fitted with a binding screw. Two blades were made for the slot of 5-16 in. x 1½ in. tool steel—one a thirty-second longer than the other. One blade was to be a rougher for the hole and the other a sizer. These tools are shown in the drawing—to a larger scale than the wheel.

When the next lot came in, I put on the chuck and gripped a wheel. It centred very closely and did not need changing. Then, with a tool I faced off the end of the hub and locked the carriage so that all the wheels would be alike and with no new setting of tools. With the hand feed on the tail-stock, the roughing cutter was run to the bottom of the hole and then changed for the finisher. This one demanded a little shifting of the tailstock to bring the cut to size, but once set it was set for all. I then got hold of Jimmy, the apprentice, and coached him on the job. After he had done two or three, he became expert, and finished the remaining twenty in 4½ hours. It will be seen, therefore, that the $5—it had amounted to $6—was not going to be long in paying for itself.



TENSION ON CYLINDER COVER STUDS.

By R. Bell.

I READ with interest the article, entitled "Tension on Cylinder Cover Studs," by J. H. Rodgers, in the Feb. 5 issue of **Canadian Machinery**.. From such articles there is certainly a great deal of benefit to be derived, and especially by us in the outlying districts of this western land, where we are out of reach of technical schools and other such excellent institutions.

While the answer may seem very clear to each of us, whatever may be our opinion, still there is always the other side to consider, and, in doing so, we may have to hunt out some of our old text-books, which may have the dust of years on them, though they ought not to have; and, although we may not get any new light on the point at issue, still we are the gainers by having considered two sides of some problem, which, perhaps, never before crossed our minds. Could we but have some such question brought before us each week and debate it out in our own minds or with our fellows, many a man would get out of the rut and become a thinker instead of a mere machine.

With regard to the question raised, I am of the same opinion as Mr. Rodgers. The pressure on the studs does increase, and the figures shown in the article demonstrates to my mind quite clearly the conclusions arrived at. I reason it out in this manner. The sketch shows a cylinder and cover which, for the sake of demonstration, is made so that the cover is free to move through a certain distance. The spigot of the cover goes well into the cylinder, and is steam-tight where it fits into the cylinder. There is further a compressable joint between the cylinder and cover. The area of the cylinder is 100 square inches. Suppose the cover, instead of being held in place by studs, to be blocked up by means of a strong steel balance and have pressure applied by a screw jack interposed between the balance and cover until the balance shows 10,000 lbs., being the pressure mentioned in the original question raised by Mr. Jones; in other words, ten

TENSION ON CYLINDER COVER STUDS.

studs screwed up to a tension of 1,000 lbs. each.

Now, I hold that for every 1 lb. per square inch of steam pressure admitted to the cylinder the balance will show another 100 lbs. The pressure mentioned in the question is 80 lbs. per square inch, and this on an area of 100 square inches would be 100×80=8,000 lbs. Our balance at this pressure would, therefore, register 10,000+8,000=18,000. The balance is taking the place of studs in this experiment, and if the balance indicates this extra pressure, why should the studs likewise not receive it?

With regard to the question raised by Mr. Orr: "Does the pressure of steam against the inside of a cylinder cover lessen the screwing-up presure with which the studs hold the cover against the cylinder end?" I should say it certainly does, and that pressure reaches zero when the pressure exerted on the inside of the cover is equal to the total tension on the studs holding the cover in place. The tensile strength of the studs, of course, continue to hold the cover in place after that point is reached.

Arithmetic for the Machinist and Workshop Operative

By J. H. Rogers

Doubtless some of the elementary work in the first few articles of this series may appear more or less superfluous, but it must be remembered that numerous simple rules and formulae appear from time to time in Technical Journals, which are discarded and dubbed impractical by many operators for the simple reason that the elementals are either unknown or have been forgotten. The purpose of this course will have been achieved if the above tendency is even in part combatted.

INTRODUCTORY.

IT seems to be the unversal opinion among a great number of present-day mechanics and apprentices, that the use of figures or a general knowledge of advanced arithmetic should belong to the man higher up, the foreman, superintendent, or draughtsman.

While, to some extent, the present methods of modern manufacture, especially in large establishments, tends to eliminate from the average workman one of his greatest assets, that is, the mental faculty, which enables him to see and do things before they are actually performed, there should be no good reason why the workman, to some extent, does not become conversant with the theoretical portion of his daily labors. Some men may argue that the use of mathematics in the shop is of little importance to the average man or boy employed at the bench, on the machine, or in the power plant.

This reasoning may hold good if the man or boy has become content to remain at his present level for all time to come; but, to the ambitious person who is desirous of climbing farther up the ladder, it behoves him to fit himself to the duties of the rung above that on which he is standing. How often do we hear the remark? "He's a lucky guy," when the more reasonable view to take would be that of asking the question, "Is he a lucky guy?"

While luck or pull may have something to do with the advancement of a few, it is generally the ability of the person that secures for him the position, and his fitness that keeps him there. Few, if any, of us, would proceed very far if we were to wait and let someone push us into one of these "lucky" jobs. Although it is true, that the wheels of industry to-day are kept in motion largely by the strength and energy of men of muscle, it remains an unquestionable fact that these same wheels were first put in motion by men of brains.

Where would the steam engine of to-day be had it not been for the active mind and reasoning faculty of Watt and Stephenson?

What would the world be deprived of to-day, but for the discoveries by scientifically applied thought of such men as Franklin, Volta, Faraday, Ohm, and Ampere, and the ever-planning of Edison and Marconi?

When the identity of lightning and electricity was discovered by Benjamin Franklin, people asked, "Of what use is it?" The retort of the great philosopher was, "What is the use of a child? It may become a man." Many great revolutionary projects of to-day had apparently very insignificant beginnings, and the same may prove true of many men and boys whose only ambition seems to be to fill in the few hours that they spend in the factory.

Problems of the Daily Task.

Granting that the use of higher mathematics may be the special duty of more learned men than those usually found in the workshop, there are still many problems that the mechanic meets in his daily labors that could be more intelligently handled than at present if a general knowledge of the art of figuring was better understood by those called upon to face these questions.

Many of these shop problems, if given to the average boy just after leaving school, could be correctly solved, but the fact that the young men of to-day usually spend a year or more after leaving school before they settle their minds to the adoption of a trade leaves time enough for their brains to become rusty. Even polished steel will become oxidized if care is not taken to retain the surface of the metal.

Of what use is the knowledge we received while at school if in after life we do not take advantage of it when the occasion demands? Many workmen who are capable of solving a written question in certain lies of mathematics seem unable to grapple the same problem when met in a practical way in the shop. The study and application of calculation to practical problems in the shop exerts an influence in broadening the mind, and often keeps a person from becoming an automation or human machine.

This course of lessons in practical shop arithmetic while intended for those not conversant with the application of the principles of mathematics as applied to shop problems may also prove of some interest and help to those who to some extent are accustomed to using calculations in their daily efforts. In outlining the lessons, it will be assumed that the readers are familiar with the four elementary principles of arithmetic, namely: addition, subtraction, multiplication, and division as taught in the public schools. As far as possible the problems and solutions will deal directly with practical work, so as to appeal to the average man or boy working in machine shops, power plants, and engineering works, generally.

Throughout the course, many formulae will be necessary, but those who are not familiar with this branch of mathematics should have no scruples about using them, as they are only a short method of expressing a rule, and a little study on the part of the average man or boy will make them sufficiently proficient to understand those met with in this series of shop lessons.

Arithmetical Axioms.

Arithmetic is the art of reckoning or study of numbers.

Addition is the process of finding the sum of two or more numbers. The sign of addition is + (plus). The sign of equality is = (equals); thus, 9+2=11 would read nine plus two equal eleven.

Subtraction is the process of finding the difference between two numbers. The sign of subtraction is — (minus); thus 40—15=25, and reads forty minus fifteen equals twenty-five.

Multiplication is the process of multiplying one number by another, or adding one number to itself a certain number of times. The sign of multiplication is × (times or multiplied by); thus, 25×5=125 reads twenty-five times five equals one hundred and twenty-five. Again by addition, 25+25+25+25 +25=125.

Division is the process of finding how many times one number is contained in another. The sign of division is ÷ (divided by); thus, 42÷7=6 reads forty-two divided by seven equals six.

Chart (1) illustrates the position and names of the various terms used.

Cancelation.

Many calculations in multiplication and division can be considerably shortened by cancelation, or the casting out of equal factors from both dividends and divisor.

The factors of a number are those numbers which, when multiplied together will equal that number; thus 12 and 6 are factors of 72 since $12 \times 6 = 72$.

Canceling equal factors from both divisor and dividend does not alter the quotient. Thus, dividing each term of the fraction 48/64 by 4 we get 12/16; again dividing each term by 4 we have ¾. When canceling, be sure and remove an equal factor from both terms of the fraction. Example:—

Divide $18 \times 15 \times 24$ by 5×36.

Solution:

$$\frac{\overset{1}{\cancel{18}} \times \overset{3}{\cancel{15}} \times \overset{12}{\cancel{24}}}{\underset{1}{\cancel{5}} \times \underset{1}{\cancel{36}}} = \frac{1 \times 3 \times 12}{1 \times 1} = \frac{36}{1} = 36$$

Explanation:—The 5 in the divisor and the 15 in the dividend are both divisable by 5, as $5 \div 5 = 1$ and $15 \div 5 = 3$. Again $18 \div 18 = 1$, and $36 \div 18 = 2$. Further, $2 \div 2 = 1$ and $24 \div 2 = 12$. The cancelation being complete leaves the relation of the dividend to the divisor the same as before, but much simplified. Multiplying the remaining factors in both terms, we have $1 \times 3 \times 12 = 36$ and $1 \times 1 = 1$; then $36 \div 1 = 36$.

To avoid confusion, always cross out or cancel the factor affected by the process of the division. It is usual to omit the 1 when a factor is being divided by itself, as:

$$\frac{\overset{3}{\cancel{6}} \times \overset{3}{\cancel{6}} \times 1}{\underset{2}{\cancel{6}} \times 2} = \frac{3 \times 3 \times 1}{2} = \frac{9}{2}$$

Example, see Chart 2.—An emery wheel is required to have a speed of 2,200 r.p.m. The main shaft has a speed of 185 r.p.m., and diameter of pulley on work shaft, W.S.=4 inches. Assuming we have pulleys for counter-shaft of 24 inches and 15 inches diameter, find the main-shaft.

In problems of this nature the speed of the driving shaft multiplied by the diameters of all the driving pulleys will equal the speed of the driven shaft multiplied by the diameters of all the driven pulleys, or expressed in the formula, Chart 2.

Revs. of M.S. $\times$ Dr. = revs. of W.S. $\times$ Dn., or

$$\text{Revs. of W.S.} = \frac{\text{Revs. of M.S.} \times \text{Dr.}}{\text{Dn.}}, \text{ then}$$

diameter of driving pulley on main-shaft

$$= \frac{2200 \times 15 \times 4}{185 \times 20} = \frac{1100}{37} = \frac{\overset{3}{\cancel{1100}}}{\underset{37}{\cancel{37}}} = 29\frac{27}{37} \text{ ins or}$$

$$\frac{37}{2} \quad \frac{6}{}$$

say, a 30 in. pulley.

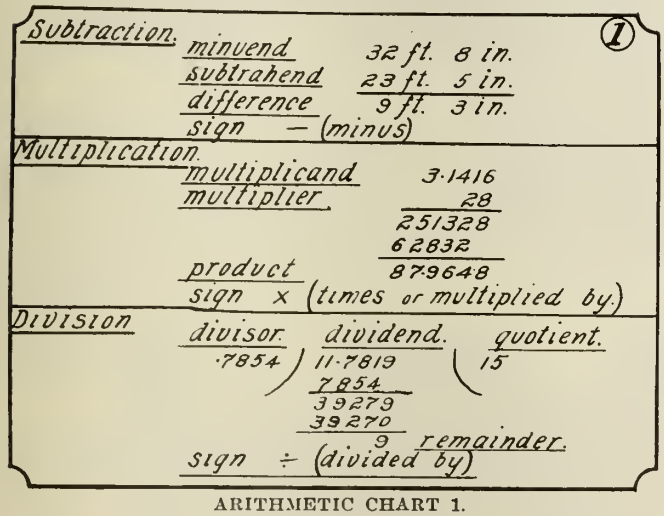
Fractions.

A common fraction is a certain part of a whole number.

The terms of a fraction are the numerator and the denominator.

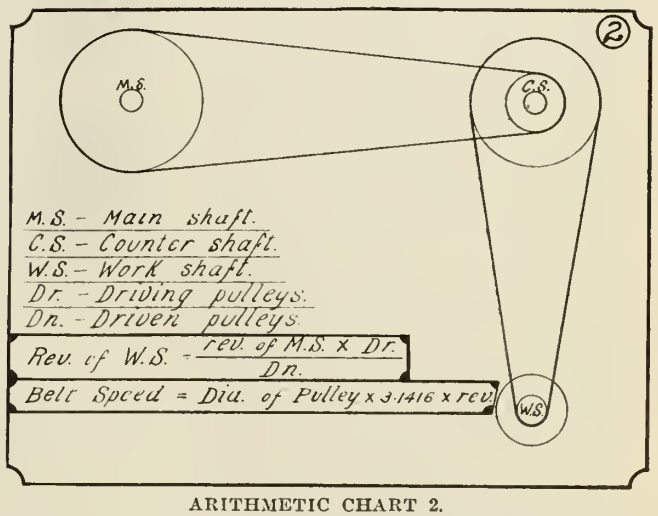
The value of a fraction is the numerator divided by the denominator.

A fraction may be changed to higher terms of the same value by multiplying both terms by the same number; as ⅜ to twenty-four sixty-fourths. Multiplying each term by 8 we get $3 \times 8 = 24$, and $8 \times 8 = 64$, therefore $\frac{3}{8} = \frac{24}{64}$.



Also, to change to lower terms having the same value, divide, if possible, each term by the same number.

To reduce a fraction to an equal fraction having a given denominator. Divide the given denominator by the denominator of the given fraction, and multiply both terms by the result. Thus ⅞ to thousandths. Then $1000 \div 8 = 125$, and multiplying both terms by 125, we have 875/1000.



In addition and substraction of fractions, the fractions must be changed so they will have a common denominator. Thus, it would not be convenient to add ⅜, ¾. 7/16, 33/64 and 35/100. We must change them to fractions of the same value but with a common denominator. To accomplish this, we place the denominator in a row, thus

8	4	16	2	64	100
			2	32	50
				16	25

If any of these numbers are contained equally in one or more of the others, it may be eliminated. thus, four goes into 8, therefore, cancel 4. Eight goes into 16, therefore, cancel 8; sixteen goes into 64, therefore cancel 16. This leaves 64 and 100. Now. 64 will not go into 100; but we see that there are still factors of both numbers that are common to each other. To eliminate these, we proceed as follows:—Divide both numbers by a prime number; in this case 2. We get 32 and 50: Again, dividing by 2 we get 16 and 25. Now, these numbers, 2, 2, 16 and 25 when multiplied together will give what is known as the Least Common Denominator.

ARITHMETIC CHART 1.

ARITHMETIC CHART 2.

Addition of Fractions.

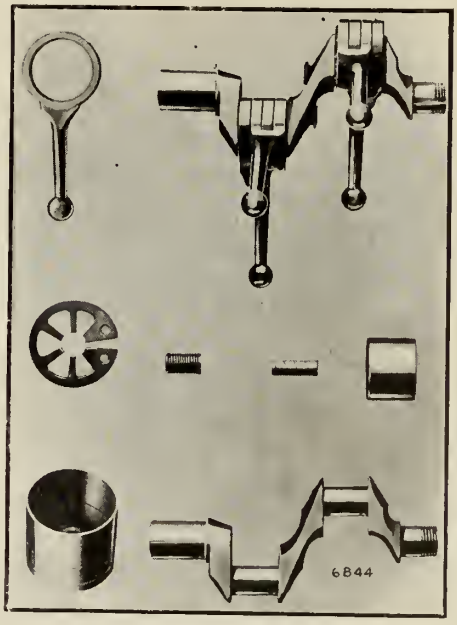
When changing to fractions having the least common denominator, write the sum of all the numerators over the common denominator, and, if necessary, change to a mixed number.

Subtraction of fractions.

When changing fractions to other fractions having a common denominator, subtract the numerators as is done in whole numbers and place the difference over the common denominator.

Multiplication of Fractions.

In multiplication of fractions, it is not necessary to use a common denominator. Divide the product of the numerator by the product of the denominators. All factors common to both terms should first be cast out by cancelation. When mixed numbers are involved, first change them to improper fractions; and if the answer is an improper fraction, change to a mixed number.



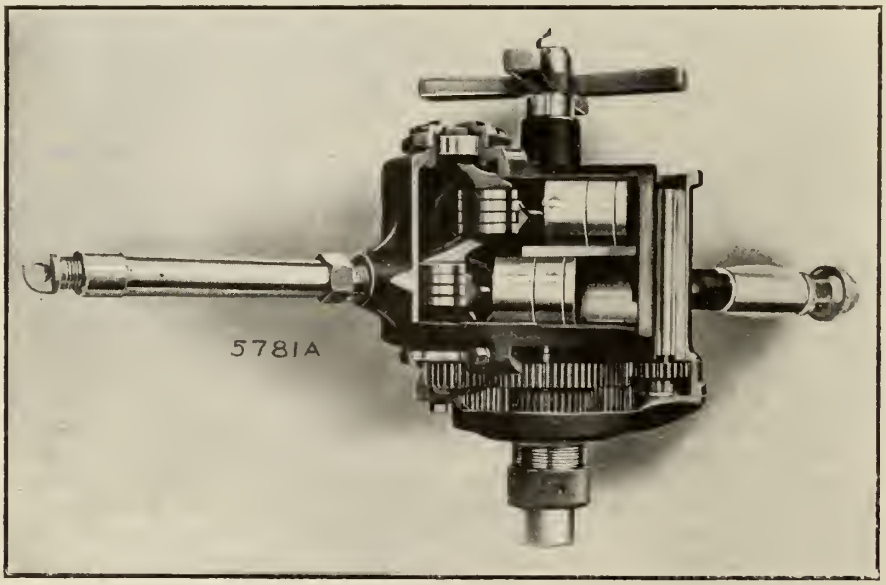
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

ROLLER BEARING PNEUMATIC DRILL.

THE noteworthy recent advance in the pneumatic tool line is the improved "Little David" drill which was brought out a short time ago by the Canadian Ingersoll-Rand Co., of Montreal, and the Ingersoll-Rand Co., of New York and London. This is claimed to be the only drill on the market having connecting rods running on roller bearings combined with crank shafts running on ball bearings. In addition, the new tool has all the advantages of the previous type, such as unusual accessibility to all parts, absence of peined and hinged joints on the connecting rods, and cylinder heads cast integral with the drill casing.

The fewness of parts and general simplicity of the tool are striking features. The shell is so designed that the entire motor apparatus may be assembled or disassembled through the crank case by the removal of the cover. The motor or engine is of the angular, four-cylinder, single-acting, reciprocating piston type, each pair of pistons being attached to opposite throws of a double crank sbaft, and each acting in balance. All four connecting rods are exactly alike and are interchangeable. Each consists of but a single part made by drop-forging a piece of selected steel. The connecting rods run on Hyatt roller bearings. The connecting rods are attached to the pistons by ingenious spring arrangements, whereby ease of assembling is secured. The piston ends of rods are ball shaped, over which the flat steel springs are slipped. These balls have their bearings in the centre of the pistons, forming ball and socket joints, permitting the connecting rods to yield to pressure from any direction without causing the pistons to bind in the cylinder. This construction also permits the pistons to turn in the cylinders so that wear is evenly distributed.



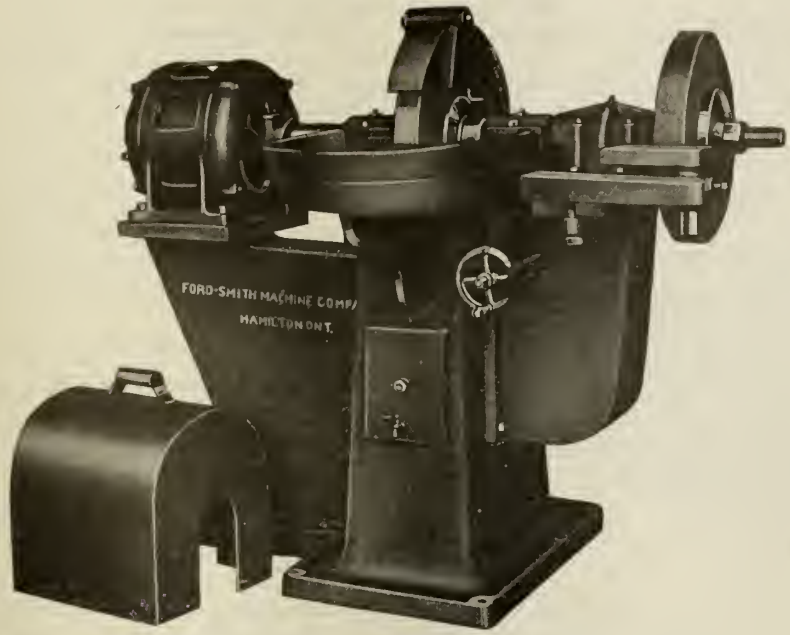
ROLLER BEARING CRANK AND CONNECTING RODS.

The crank shaft works in F. & S. silent-type ball bearings. These are of the separator type, which is claimed to be superior to the full type of bearing for machines of this character operating at medium and high speeds, as, in the full type of construction, the balls come in contact and wear flat rings on their circumferences in very short time, resulting in loose bearings and generally unsatisfactory operation. This rapid wear is largely due to the fact that the balls are rotating in opposite directions at their points of contact, and the wearing effect is therefore doubled.

The spindle is provided with a ball thrust bearing interposed between the shell and feed spindle in such manner that the main frame is relieved of all thrust or strain. Each valve controls two pistons which act on alternate strokes. The valves being completely balanced and of the rotating type instead of reciprocating, wear is equalized. The valves are geared to the crank shaft through the medium of a spindle gear. The valves are geared to the crank shaft ground, operating in bronze bushed chests, giving a combination of two ideal wearing surfaces. The setting of the valves is simple, it being merely necessary to see that the letters stamped on the valve and crank shaft pinions register with letters on the main gear. With the exception of the valve bushings, all parts subject to wear and strain are made of special steel, hardened and ground to close working fits, designed to secure the utmost lightness, consistent with ample strength.

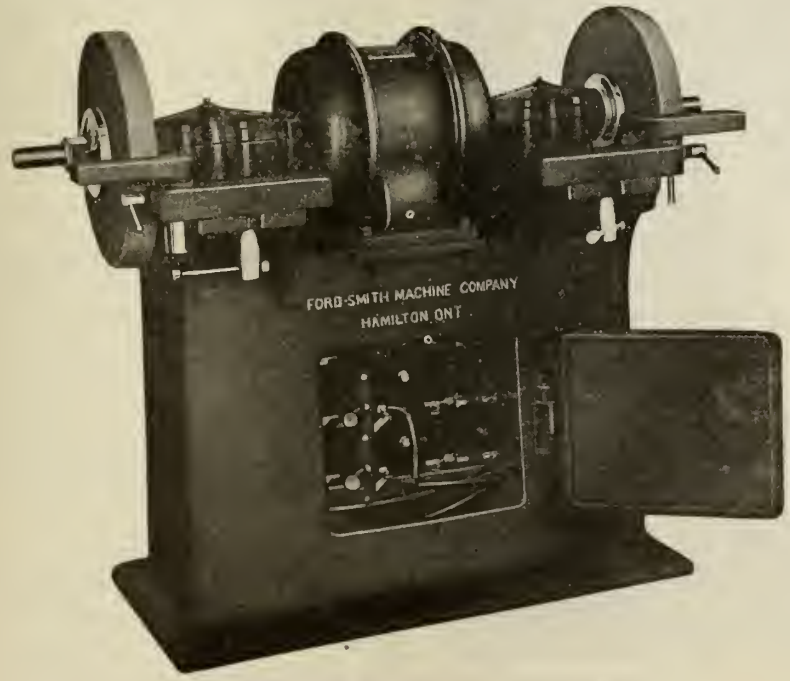
These tools may be made reversible or non-reversible at the will of the operator, this being accomplished by changing the position of a sliding sleeve on the throttle handle. With the exception of the light wood-boring type, all sizes are provided with compound gearing, insuring great power at all speeds.

The "Little David" drill is made in five sizes. No. 1 is for heavy drilling, reaming, tapping and flue rolling. No. 2 is for similar work of a lighter nature, while No. 3 is for light drilling and reaming. The No. 12 size is fitted with a chuck for a 4-in. wood-boring auger, and the No. 13 size has a chuck for a 2-in. wood-boring auger.



ROLLER BEARING PNEUMATIC DRILL PARTLY IN SECTION.

The Pratt & Whitney Co. of Canada, Employees, held their annual banquet on the 6th of February at the Central Hotel, Dundas, Ont. A very enjoyable evening was spent, consisting of songs and instrumental music by various members of the staff. The proceedings were ably presided over by Mr. W. H. Tims, the factory superintendent.



MOTOR-DRIVEN GRINDERS.

TWO interesting types of motor-driven grinders for general purposes, such as foundries, machine and railroad shops, are here illustrated. These grinders are standard types, and

COMBINATION WET AND DRY GRINDER.

are manufactured by the Ford-Smith Machine Co., Hamilton, Ont. The advantages of a motor-driven grinder is that it dispenses with the need of high-speed countershafting, and can be placed in

16-INCH MOTOR-DRIVEN FLOOR GRINDER.

any convenient position in the shop to suit both the light and other work for which its service is required. Especially is this true of foundries and erecting floors where line shafting is often not installed, and also where the service is intermittent.

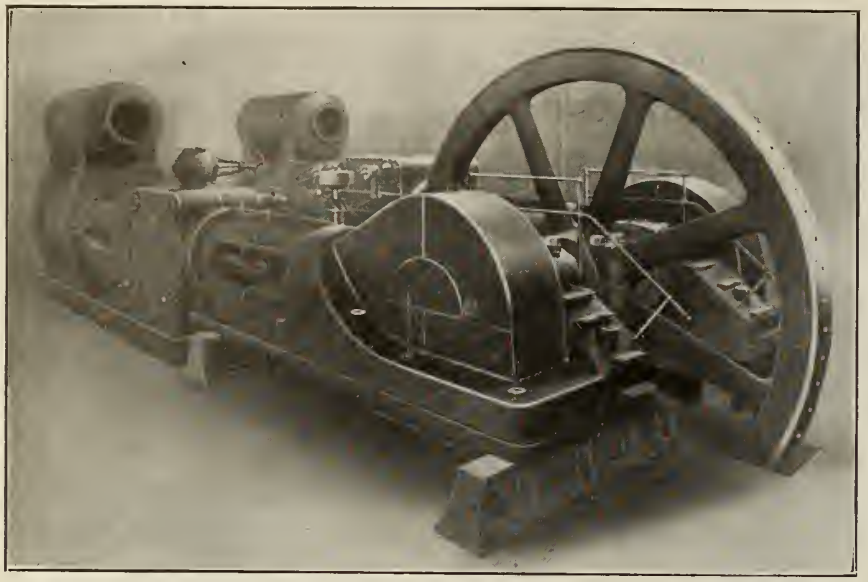
The 16-inch motor-driven floor grinder shown in the illustration is built in sizes to take wheels from 10 to 30 inches diameter. This machine is of heavy construction, rigid and compact, being equipped with rests of ample strength, and convenient of adjustment by vise handles, thus doing away with the need of wrenches. The ring oiling bearings are adjustable for wear and of ample length, and are also furnished with felt dust-proof washers. The spindle is of special steel, and can be renewed when worn without interfering with the motor. It is fitted with adjustable locking nuts for taking up the end wear. The motor is fully enclosed, pipe ventilated to the base, and is specially designed for this class of work. It is built either for a.c. or d.c. current, and has a large margin of power for the service required. The switch gear is of the "iron-clad" type, and is located inside the box body, access being obtained by opening the door.

The motor-driven wet and dry grinder is of similar design, with the exception of the location of the motor and the addition of the water tank and bowl. The motor in this case is only partially enclosed, but is fitted with a detachable hood for protection against water or dust. This type of grinder is made to take wheels up to 36-inch diameter. Both types of grinders are usually fitted with the Ford-Smith safety collars and steel protection hoods.

RECORD IN BUILDING LARGE ENGINES.

WHAT is believed to be the world's record in constructing engines was recently accomplished by the Mesta Machine Co., of Pittsburg, Pa., in building two horizontal cross compound blowing engines for the Woodward Iron Co., Woodward, Ala. The first engine was completed and loaded on board cars at the Mesta Works in 38 days, and the second one in 59 days from the date of signing the contract at Woodward, Alta. Each of these engines embraces one high pressure steam cylinder, 48 inches in diameter, one low pressure steam cylinder 84 inches in diameter, and two air cylinders 84 inches in diameter, with a stroke of 60 inches.

The Woodward Iron Co. had installed two large turbo blowers to furnish blast for their new 500-ton furnace, recently completed. These blowers were in operation for about a week, only, when both were wrecked. It was then decided to replace them by reciprocating steam engines. After investigating different types, they decided on horizontal cross compound steam engines. Quick delivery was of course all important.



The Mesta Machine Co. offered their new type of horizontal cross compound blowing engine, equipped with the Iversen patent automatic plate valves, and agreed to deliver the first engine on board cars at the Mesta Works in 90 days and the second engine in 120 days. On November 15, 1913, a contract was signed for two of these engines, with delivery as stated above, a bonus and penalty clause being included.

The magnitude of the task is better realized by a statement showing the work handled. The engines weigh 1,800,000 lbs., and contain 10,210 pieces.

The lightest piece weighs one-fourth of an ounce, the heaviest piece 94,550 lbs.

Description of the Engines.

The engines are of the horizontal cross compound type, with the air cylinders placed directly back of the steam cylinders. Both the high and low pressure steam cylinders are equipped with Corliss valve gear and the air end with Mesta (Iversen Patent) automatic inlet and outlet valves. These valves require no valve gear, and allow the air large receiver is placed over the air cylinders, which practically eliminates vibration in the air lines to the furnace. The engines are designed for 30 lbs. air pressure and to run at a speed of 80 r.p.m.

48-84-84 IN. X 60 IN. CROSS COMPOUND BLOWING ENGINE ON ERECTING FLOOR.

AIR RECEIVERS AND AIR CYLINDER ENDS 48-84-84 IN. X 60 IN. CROSS COMPOUND BLOWING ENGINE.

cylinders to be placed directly back of the steam cylinders. This same arrangement is used also in the design of Mesta gas driven blowing engines. A

IMPROVED MEASURING TAPES.

MEASURING tape cases in use are of various construction but in a general way it is true that until now the superior features of a steel case liner for leather cases and a push button opener for winding handles have been embodied only in the very highest priced steel measuring tapes. The Lufkin Rule Co. of Canada, Ltd., Windsor, Ont., announce that they have now added these improvements to their general line of steel tapes and without advance in price.

"Challenge" and "Challenge Junior" steel tapes now have leather cases steel lined throughout. This gives extraordinary stability. The case is also narrower than before by a full ⅛-inch, hence a neater appearance, more compactness. The cases now have also a positive action push button opener of new design for the winding handle.

"Rival" and "Rival Junior" steel tapes have nickel-plated steel cases as before, but are now also equipped with a positive action winding handle opener like the "Challenge" and "Challenge Junior" mentioned above.

UNIQUE POWER PLANT FOR FORD MOTOR CO.

THE Ford Motor Co., says the Iron Age, has placed contracts for a gas engine-electric power plant that will be not only one of the largest in the country, but in many respects altogether unique. The Company has appropriated in the neighborhood of $1,000,000 for the project, which will put into effect plans Henry Ford has long had in mind for utilizing the waste heat of the ordinary producer gas engine.

Four 6,000-h.p. Hamilton-Gray gas engines of novel design will drive the same number of Crocker-Wheeler 3,750-k.w. 250-volt 80 r.p.m. engine-type direct-current generators, but one pair of cylinders will be operated by producer gas and the other by steam. The steam will be generated from the water used in the water jacket of the gas engine, further heated by the exhaust gases and by waste heat from the producer gas plant. This water or steam will be used as the feed water for the boiler which supplies the steam engine cylinders. A heavy flywheel will equalize the characteristics of the gas and steam driven elements of the engine. Each of the generators will have a normal rating of 3,750 k.w., the largest capacities on record for generators of this type. Each engine will appear as a cross-compound engine with two cylinders in tandem on each side.

Kelly Floating Reamers Going Abroad.

Through its English agents, C. W. Burton, Griffiths & Co., London, E.C., the Kelly Reamer Co., Cleveland, received on February 10, a $1,200 order for Kelly-Adjustable-Floating Reamers and Boring Tools after three months' trial by a large English manufacturer, who finds that the "Floating Reamer" eliminates "grinding."

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

W. F. Vilas, of the Vilas Implement Works, has been re-elected Mayor of Cowansville, Que.

J. Lanning, B.A.Sc., has been appointed a superintendent in the smelter works of the Mond Nickel Co., at Coniston, Ont.

J. E. Long, safety engineer, Montreal, has been engaged to inaugurate a "Safety First" system on the Intercolonial Railway.

Arthur W. White, London, was elected to the presidency of the London Canadian Club at the annual meeting last Thursday evening.

John S. Dickson, of the firm of Dickson Bros., bridge builders, Campbellford, Ont., was found dead on the G.T.R. line, near Belleville station, last Friday.

Kenneth Morrison, at the head of a new company who will erect a nail plant on Lulu Island, B.C., was formerly mechanical superintendent for the Dominion Iron and Steel Co., Sydney.

W. E. Woodhouse, late assistant superintendent of motive power, C.P.R. western lines, has been appointed superintendent of motive power with offices at Montreal.

Thomas Watson, manager of the Wind Motor Co., Woodstock, Ont., will be general manager of the Concrete Machinery Mfg. Co., Woodstock, which is an amalgamation of the above plant with the Mitchell Crusher Mfg. Co., Toronto.

George Minorgan, who with his two sons, has taken over the foundry formerly run by the Reid-Easby Co., at Beaverton, Ont., has for upwards of thirty years been foreman of the implement and machine works of Peter Hamilton, Peterborough.

W. St. H. LeSueur, for the past year and a half advertising manager for the Tudhope-Anderson Co., Orillia, Ont., has severed his connection with that firm, and left last week for Berlin, Ont., where he has accepted a similar position.

Jeffrey G. Omnanney has been appointed special engineer to Sir Thomas Shaughnessy, of the C.P.R. The notice of his appointment states that he will perform such duties as might be assigned to him from time to time by the president.

Hon. N. Curry has joined the board of the Halifax Tramways Co.

V. G. Curry, vice-president of the Canadian Car and Foundry Co., was in Brantford last week.

W. A. Gerolamy, Tara, Ont., who formerly conducted an extensive foundry business, died here last Thursday, aged 82.

WHO'S WHO?

C. M. MURRAY,
Sales Manager, Chapman Double Ball-Bearing Co., Toronto.

George T. Clark, city engineer, of Saskatoon, until a short time ago, has entered the firm of Western Pavers, Ltd., and will take charge of constructional work for this company in Western Canada.

Daniel Knechtel, president of the Knechtel Furniture Co., Hanover, Ont., narrowly escaped death last Thursday, when a steam pipe extending from the boiler to a machine used for bending steamed wood exploded. The machine was wrecked and damage done to the extent of several hundred dollars.

Wingham, Ont.—E. Merkley visited Toronto last week and purchased a quantity of heavy machinery to be used in a machine shop which he intends operating in the near future. The machinery purchased includes a heavy 20-foot lathe, planer, shaper and power drill. He is also arranging to install an electric motor.

Sydney Smith, head draughtsman of the Jenckes Machine Company, Sherbrooke, Que., sailed for England, Saturday, Feb. 7. He was summoned by the illness of his wife, and expects to be absent six weeks or more.

J. H. Fairbank, Petrolia, Ont., died on Wednesday, Feb. 10, aged 83. He was the sole owner of the Stevenson Boiler & Engine Works, the principal stockholder of the Petrolea Wagon Co., Ltd., and the largest individual oil producer in Canada.

W. F. Bullen and H. F. Bullen, who recently sold their shipbuilding plant to Yarrok & Co., were banqueted in Victoria last week, by prominent Victorians who desired to recognize their services in furthering the interest of the ports of Victoria and Esquimalt. Premier McBride and others spoke.

D. G. Loomis, the head and founder of the well known firm of D. G. Loomis & Sons, contractors and manufacturers, Sherbrooke, Que., has retired from the active business of the firm, which will be conducted by W. E. Loomis, and F. H. Loomis, of Sherbrooke, and Montreal, respectively.

F. N. Speller, B.A.Sc., a graduate in engineering of the University of Toronto, now a metallurgical engineer for the National Tube Co., Pittsburgh, Pa., gave a lecture on the manufacture of steel pipes and tubes before the University of Toronto Engineering Society and members of the Central Railway Club, Toronto, last Thursday.

R. J. Mackenzie, son of Sir William Mackenzie, who returned to Winnipeg last week after an absence of two years in California, will, it is stated, become active head of the Canadian Northern lines west of Lake Superior to the Pacific coast, taking the position of second vice-president.

L. L. Henderson, of the Montreal Transportation Co., Toronto, has been elected president of the Dominion Marine Association. The other officers are: First vice-president, A. E. Matthews, Toronto; second vice-president, H. W. Richardson, Kingston; Executive, George E. Fair, Collingwood; H. H. Gildersleeve, Sarnia; S. V. McLeod, Sault Ste. Marie; D. Murphy, Ottawa; J. N. Norcross, Toronto; F. S. Wiley, Port Arthur; A. A. Wright, Toronto; C. B. Harris, Toronto; H. W. Cowan, Toronto. Counsel, Francis King, Kingston.

INDUSTRIAL NOTABILITIES--No. 22

WILLIAM FORREST ANGUS, Vice-President and Managing Director of Canadian Steel Foundries, Ltd., is the son of Richard B. Angus, one of Montreal's best known citizens, and of Mary (Daniels) Angus. He was born October 28, 1874, at Montreal, with which city he has been connected all his life. On his father's side the family is of Scottish descent, and on the mother's, English.

Mr. Angus was educated in the private schools of his native city and later at McGill University, whence he graduated with the degree of B.Sc. In 1896 he went to the Dominion Bridge Company as engineer and draftsman for one year, afterwards joining the Laurie Engine Company for a short time. It was in the year 1897 that he became interested in the Canada Switch & Spring Co., and this date marks the commencement of his long and intimate connection with the steel casting industry in Canada. The Canada Switch & Spring Co. was subsequently formed into the Montreal Steel Works, and, with this latter concern, Mr. Angus occupied various positions of importance. When he first joined the old company all their steel castings were made by the crucible process, in what would now be considered very small quantities. Later, a Tropenas Bessemer Converter was installed, which marked a decided step in advance of previous methods. The demand for steel

WILLIAM FORREST ANGUS.

castings grew rapidly with the development of the country, and in the year 1900 an open-hearth furnace of 15 tons capacity was put in. It will thus be seen that Mr. Angus has witnessed the growth of the Canadian steel casting industry from its earliest infancy, and is thoroughly familiar with every process.

On January 1st, 1911, the Montreal Steel Works was absorbed by the then newly-formed Canadian Steel Foundries, Limited, and Mr. Angus became Vice-President and Managing Director, which position he still holds. This company has three steel foundries, two in Montreal, and one in Welland, Ont., the combined output amounting to about 5,000 tons of castings per month.

Mr. Angus is much interested in the "Safety First" movement, and has been instrumental in introducing it into all three plants of the company. An educational campaign is being conducted by means of literature distributed to the employees, and a local committee in each plant meets regularly and reports on defective machinery or any other dangerous condition that may come to their notice. In addition, there is a general committee, composed of the plant managers, and this meets every two or three weeks to discuss safety appliances and make recommendations regarding the minimizing of the risks under which the men work.

Mr. Angus is a member of the Mount Royal, the St. James, the Forest and Stream, the Montreal Hunt, the Royal St. Lawrence Yacht, and a number of other clubs. His principal hobbies are automobiling and golf. He was married November 9th, 1904, to Miss Stearns, daughter of Sargent Stearns, of Montreal.

TENSION ON CYLINDER COVER STUDS.

THE article which appeared on pages 129 and 130 of our Feb. 5 issue, entitled **Tension on Cylinder Cover Studs**, appears to have touched a responsive chord in the heart and head of quite a large circle of the readers of **Canadian Machinery**. We say heart as well as head because of the large number of expressed opinions received for publication, it being a well-known fact that timidity or want of heart courage has been and is robbing the pages of technical journals by retaining in more or less obscurity a myriad forms of high degree inventive genius with its resultant accomplishment. We refrain from making comment meantime on the particular question under discussion, it being sufficient as well as gratifying to know that given the opportunity to cultivate and develop their beings along the line of higher grade intelligence, most men will quit the groove of the automaton.

There is an impelling attractiveness and fascination in analyzing and figuring out problems involving more or less arithmetical calculation, and even although in some cases there may be an unconscious disposition to read into them more than is really involved, the ultimate results are all on the credit side. The features, however, that make study of this nature more valuable are the knowledge that a collective intelligence is being concentrated on the work of each individual, and that a corresponding benefit thereby accrues. There is absolutely no necessity for an operator harboring uncertainty in his mind, at this time of the day, as to the why, wherefore and proof of design and detail of mechanical engineering construction, and if a little more heart—pluck if you like—were brought to support the head, by readers bringing their difficulties and problems out into the open so that others could join in and help the originator and themselves, the standard of operative ability would be materially raised, and greater achievement of the craft would be made easily possible.

Another set of readers' opinions on the problem will appear in our next issue, lack of space limiting the publication of all of those received in the present instance.

THE NATIONAL TRANSCONTINENTAL RAILWAY INVESTIGATION REPORT.

A FEW weeks ago we discussed **The Attribute of Honesty** in these columns, but confined our remarks more particularly to the sphere of industrial enterprise as exemplified in the policy and management of large manufacturing and transportation corporations. Deviation from the **straight and narrow** is no monopoly of those directly responsible for our commerce and industry, although unfortunately an indirect influence is exerted by them otherwise. Legislation, having for its object the opening up of new territory to agricultural and industrial pursuits by the establishment of railroads and their myriad accessories, it would seem, easily takes precedence both in the matter of opportunity and scope afforded for playing fast and loose with every moral standard.

The report of the investigation into the building of the National Transcontinental Railroad of Canada, so far as made public, is anything but wholesome reading, and while it is plainly more or less partisan in its essence, a feature that is highly regrettable, there is nothing but national humiliation in its every feature. With all our boasted democracy, we as citizens of this Dominion, are the laughing-stock of the world. The vote that puts either political party into power is neither that of a man nor of democracy, and the sins of one political party are not one whit more heinous than the muck-raking of the other. It may be said that did the former not exist, the latter would be unnecessary. This is true, but, and to get at the remedy, did we ourselves play the man instead of play for the dollar, then neither the one party nor the other would be so constituted that anything but honesty, plain, individual and collective honesty, exemplified by word and deed would be the outcome.

The N.T.R. investigation and its apparent outcome are regrettable features in our national life, and the fullest and most searching inquiry is now in order relative to the Commission finding. Happenings such as these strike at the very root of our industrial development and prosperity, and go to show that personal and selfish interests take precedence over patriotism.

When anyone becomes satisfied with himself, there is but little in him that satisfies other people.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Feb. 16, 1914.—The weather during the past week has been unusually cold and has had its effect in diminishing business in certain trades. The building industry was, of course, particularly hard hit. This trade has been slack for a long time, owing to the scarcity of money. A great improvement, however, is prophesied for next summer when a start will probably be made with the big city terminals of the Canadian Northern Railway. There is also likely to be great activity in residential construction, the present demand for houses exceeding the supply in a manner that far outdistances former years. On the other hand few large office buildings are at present projected for this year. So many buildings of this type have been erected in Montreal during the past two or three years that the demand for office accommodation seems to be fairly well satisfied for the present.

The machinery trade is still waiting for the contracts to be let for the equipment tendered on for the Prince Rupert dry dock of the Grand Trunk Pacific. This matter is being handled by W. T. Donnelly, consulting engineer, New York, and enquiries made this morning at the G. T. R. purchasing agent's office in Montreal, elicited the information that nothing was known locally as to when the orders would be placed.

Machinery houses have closed several nice orders during the past week or two, but the common complaint is that, instead of a steady volume of trade, orders come in spasms. The railways are doing very little buying just now, though it is believed that the Grand Trunk may issue specifications for machine tools shortly. Mussens, Ltd., report having sold to the Department of Agriculture and Highways of the Quebec Government two 8-ton and two 5-ton road rollers, two Farquhar traction engines, and two Austin reversible graders. They have also closed an order for three Bucyrus steam shovels for the Grand Trunk Railway.

In anticipation of an early spring, good orders for boom chains are being placed by the lumber interests. Tool steel salesmen report that business is improving slightly, though still much below normal.

The metal market is unchanged from last week. A fair quantity of foundry pig iron has been sold, but otherwise things have been quiet.

Toronto, Ont., Feb. 17, 1914.—While the demand for immediate shipment of steel shows no marked increase, there is a tendency on the part of iron and steel manufacturers to quote higher prices for future deliveries. Much depends on the nature of the order. Reasonable rates may be secured in cases where a consumer requires a large quantity of one section. Steel makers are sure that business in the second quarter will be good. They are also determined that prices in the summer will be higher than those obtaining now. For that reason local manufacturers and structural steel men are covering themselves.

The demand for boiler tubes and plates is good, and some first-class orders are being placed. Tank work has also shown signs of improvement. General manufacturers and foundrymen are not showing so much anxiety to purchase. Most of the present business is going to mill, and warehouse is quiet.

Prices the Same.

Prices on most steel products remain unchanged. While little cutting is being experienced in bars and shapes, there is a tendency for smaller manufacturers of wire and nails to offer better prices, thus taking good business out of the hands of larger concerns. Several big contracts have been lost this week by manufacturers who have a fixed price, and will not go lower to meet competition.

Since the report last week that a large steel concern in the United States was contemplating the establishment of a furnace and rolling mill on Ashbridge's Bay, Toronto, it has come to light that several American steel makers are planning an invasion of this territory. In one case it is a New England firm who have not met with much success in the American field, and are thinking of removing their whole plant into Canada.

Machine Tools.

While the steel business is picking up, the machine tool and supply business remains dead, and some of the largest houses freely admit it. The large railways who some weeks ago declared their intention of buying heavily in machine tools, are now disposed to postpone buying until a later date.

The National Transcontinental Railway who issued specifications for machine tools required at Grant and other points, costing in the neighborhood of $40,000, have postponed buying indefinitely for some reason unknown to local brokers. In this case too, recommendations had been made. This action is thought to be the result of the startling report made by the commission appointed to investigate the cost of the line.

Orders Being Placed.

The order for machine tools required by the Buffalo Forge Co. will be placed this week either in Buffalo or Berlin. These will be required for the new plant this firm has recently erected there for the manufacture of blowers and exhausters. A. G. Spalding Bros. manufacturers of sporting goods, purchased a four-spindle drill, a riveting machine, and several other tools this week, for use in their new plant at Brantford. They intend building a larger plant shortly.

As will be seen by reference to another section of Canadian Machinery, The National Cash Register Co. are purchasing a large quantity of machine tools, foundry supplies, etc., for their new plant on Christie street, Toronto. The Canadian Kodak Co. who are pre-

paring to erect a large plant in Toronto, will not be in the market for tools inside of a year, at least. The only district that seems to be buying at all freely just now, is Cobalt. They appear to have the money, and have enjoyed a good winter. There is a brisk demand for pumping machinery and general equipment.

Metals.

During the past few weeks there have been marked signs of strengthening in the metal market, but a weakness set in early this week, the price of copper dropping considerably. The business is reported by large firms to be at a standstill. A little business is being done in old material.

St. John, N.B., Feb. 16, 1914.—As the result of a start having been made in a new line of manufacturing in St. John last week, there are excellent prospects of a substantial permanent industry giving employment to a large number of men, being established. The arrangements are in the hands of Hon. S. O. Bigney, of Attleboro, Mass., and M. E. Innes, of this city, and it is necessary for them to start immediately to protect the Canadian patent on the article to be manufactured—a new line of suspenders, in which the necessary elasticity is supplied without the use of rubber. It is done by using three concealed ball-bearing springs, which will outwear the webbing without losing anything of their elasticity. The articles have been on the American market for some time, being manufactured in Attleboro, Mass., where a big plant is established. Hon. Mr. Bigney expects to have a local factory in operation very soon, and arrangements to that end are now being made.

The Board of Trade will endeavor to secure a drydock for this port similar in size to those being built elsewhere by the Government. A contract has been let at Quebec for a drydock there of 1,150 feet, and the St. John Board of Trade have appointed a committee to make representation to the Government to have the local one made at least that length.

J. Norton Griffiths, head of the Norton Griffiths Co., Ltd., was in the city last week and said that the working plant of his concern at Courtenay Bay, East St. John, would be greatly increased as soon as they could secure more dredges. "Four more dredges are to be brought here," he said, "and it is possible that we may build one in St. John. If we build, the machinery will be secured in Canada and the construction of the dredge will be commenced at once at Courtenay Bay. This suction dredge will have a twenty-inch sucking apparatus and will have cutters arranged so as to reach to a depth of more than fifty-five feet below the bottom of the dredge. I expect that these dredges will be here in April and the work at Courtenay Bay will be rushed to a greater extent than ever before."

Manning W. Doherty, of the Maritime Dredging and Construction Co., on his return a few days ago from Ottawa said that the timber for the new wharves at West St. John will be delivered within six weeks and work will be started immediately, and construction rushed. Two hundred men will be employed in the work, and two new berths will be completed by December 1. The Doherty Company have taken over the contract formerly held by Connelly & Charlton.

The Hewson Woolen Mills at Amherst, N.S., have resumed operations and will probably be kept running until after the committee appointed to investigate the financial history of the Hewson Pure Wood Textile Co. since the organization of that concern two years ago, have submitted their report.

Trade Gossip

Thomas Brothers, St. Thomas, who were reported in the newspapers last week to have made an assignment, will continue business, the report being incorrect.

The Sasgen Derrick Co., an Illinois corporation, has been authorized to manufacture derricks, hoists, and contractors' equipments, in Ontario. Mathias T, Sasgen, Toronto, attorney.

W. A. Casey, for the past year municipal engineer of Esquimalt, tendered his resignation to the works committee of the municipal service last week. C. H. Topp was communicated with and appointed to succeed him at once.

N. S. Steel Statement.—The annual statement of Nova Scotia Steel & Coal Co., presented to shareholders last Monday, showed net profits for 1913 of $1,255,953, compared with $1,000,609 for 1912. The excess current assets over liabilities is shown as $1,593,744.

A Profit-sharing Plan.—In response to the proffer of shares on the instalment plan made to all employees of the International Nickel Co., who conduct themselves to the satisfaction of the management, some 1,440, or 40 per cent. of those on the pay rolls of the parent and subsidiary companies have hastened to enter into the agreement.

Canada Car Employees.— From both the Dominion and Turcot plants of the Canada Car Works seven hundred employees gathered at the Montreal West End Y.M.C.A. last Thursday, and enjoyed a programme of sports and games which included bowling, swimming, billiard and gymnasium work. A tug-of-war resulted in a victory for the Dominion shops. Mr. Butler, general manager of the company, was master of ceremonies.

Lost an Industry. — The industrial commissioner of Welland, Ont., speaking on the moton to secure a block of land for factory sites, stated that a Chicago firm wishing to erect a four-storey building and employ several hundred hands had been lost last week, because a site could not be offered at a suitable price. Guelph got the concern by giving a free site. Outside of the town every bit of railway frontage had been cut up into subdivisions, so that it was now necessary to jump a mile to get a piece big enough for an industry.

The Redcliff Rolling Mills, Ltd., held their annual meeting in Medicine Hat, Alta., on Tuesday, Feb. 10, and officers and directors were elected as follows: President, W. B. Marshall; vice-president, Dr. J. C. Hargrave; secretary-treasurer, H. A. Hunter; managing director, W. F. Goodison; directors, H. O. Wheeler, Wm. Mitchell and W. H. Hargrave. The financial reports which were accepted by the meeting showed the company to be in a healthy financial condition, and the business outlook was reported to be excellent.

The Doon Twine and Cordage Co., of Doon, Ont., have made a new departure during the past week. A large room, 40 x 60 feet, in their plant, has been set apart as a reading room and a place for congregating and indulging in games. Billiard tables have been provided, which fill a long-felt want. A committee of twelve has been appointed under whose control and management the undertaking is placed. Two will be present each evening and see that the rules are strictly enforced. Others than those in the employ of the company are permitted to enjoy the privileges by paying a small fee.

The Smart-Turner Machine Co., Hamilton, Ont., have recently secured the following orders:—The Canadian Salt Co., Windsor, Ont., simplex pump; the Imperial Vinegar & Pickling Co., Hamilton, duplex pump; the Dominion Dredging Co., Port Weller, Ont., motor driven centrifugal pump; the Imperial Tobacco Co., Ltd., Montreal, Que., centrifugal pump; G. H. Dooer & Co., Berlin, Ont., duplex boiler feed pump; the Rapid Power Co., Morrisburg, Ont., centrifugal pump; the Canadian Flax Mills, St. Catharines, Ont., centrifugal pump; J. D Nairn, Bartonville, Ont., duplex power pump; S. Allen, Ltd., Norwich, Ont., duplex power pump; the London Pressed Brick & Tile Co., London, Ont., duplex pump.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Hamilton, Ont.—The assignee's sale of the Schacht Motor Car Co.'s assets took place last Tuesday.

Fort William, Ont.—A fire broke out in the plant of the Canada Iron Corporation last Friday, destroying a partition and part of the roof.

Chatham, Ont.—The Chatham Bridge Co. have been in the market for an engine and sand pump outfit. They are not ready yet to purchase machine tools.

Fergus, Ont.—Beatty Bros., Limited, are making extensions by installing a $5,000 plant for galvanizing their stable equipment.

Ottawa, Ont.—J. J. Carrick, M.P., will propose a resolution in the House that the development of Canadian iron ore deposits should be more fully encouraged by the Government.

Toronto, Ont.—A permit was issued Monday to the Canadian Seamless Wire Co. for the erection of a two-storey brick factory at 198 Clinton street, to cost $18,000.

Toronto, Ont.—The Ford Motor Co. will shortly erect a new five-storey building at the corner of Dupont and Christie streets, and from 500 to 600 workmen will be employed. The new building will be finished early next fall and work will be started on it almost immediately.

Hespeler, Ont.—Otto Gramph, of the Stamped and Enameled Ware, Ltd., has prepared samples for the Hardware Convention, at Ottawa, and during the next twelve months will make extensions to his plant.

Fredericton, N.B.—Hon. H. F. McLeod, M.P., has announced on the authority of Mr. Gutelius, general manager of the Intercolonial Railway, that the St. John Valley Railway shops will be erected here.

Montreal, Que.—The Sullivan Machinery Co., makers of air compressors and mining tools, Claremont, N.H. and Chicago, will erect a plant in Montreal for handling the Canadian end of their trade.

Sherbrooke, Que.—Mackinnon, Holmes & Co., manufacturers of steel plate and structural work, advise that they have not yet completed plans for proposed extensions to plant, but expect same to be ready shortly.

Bedford, Que.—The Bedford Manufacturing Co., makers of axes, scythes, etc., advise that they have not yet decided on the number of buildings they will erect to replace the plant burned. They hope to decide this week.

Hamilton, Ont.—The old site of the Hoepffner refinery, located in East Hamilton, will be purchased by a company to be incorporated, which will refine ores by a new process. D. M. Cameron, Aberdeen ave., is interested.

St. Catharines, Ont.—It has been agreed to fill the large number of orders received by the Shurley-Dietrich Co., Galt, for saws from the plant of the R. H. Smith Co., St. Catharines. In order that the greatly increased output may be produced, the smith factory will go on night and day shifts and a large number of the Galt employees will be given jobs at St. Catharines.

Sault Ste. Marie, Ont.—William Edward Seelye is interested in a company known as the Seelye Combination Axe & Tool Co., who will equip a plant here for the manufacture of axes, tools, and tool holders. The company has a capital of $40,000.

Medicine Hat, Alta.—Construction work has begun on the main building of the Medicine Hat Radiator Co.'s new plant. The structure will measure 80 x 290 ft. with 14 ft. ceiling and costing $100,000. L. Carey Wright, the manager, has charge of the work.

Windsor, Ont.—The Standard Mfg. Co., is opening up a branch factory in Windsor to manufacture double-acting checking floor hinges and oil checks for the Canadian trade. The head office is in Shelby, Ohio. The Windsor plant will be located at No. 3 Ferry street.

Maple Creek, Sask. — The Canadian Hunt Mfg. Co., advise us that the first building of their new plant will cost $40,000, and will be commenced this spring. They will make threshing machines, fanning mills and farm implements. The company is capitalized at $700,000.

Maisonneuve, Que.—The Structural Steel Co., of Tetreaultville, Que., are erecting a large plating shop for the Canadian Vickers Dry Dock Company. The new structure is one of the largest of its kind in Canada. Most of the machinery is being imported from England and Scotland.

Kingsville, Ont.—The R. F. Green Co. have been loaned $6,000 by the town, and will go ahead in the Spring with the erection of a plant for the manufacture of gas ranges and ovens. Cement will probably be used. Much of the equipment in the present plant will be transferred.

Windsor, Ont.—The plans as outlined for the plant of the United States Steel Corporation at Ojibway call for two or three blast furnaces, an undetermined number of open hearth furnaces, and rail, structural, bar, plate and wire mills. It is expected that ground will be broken in the spring and that the wire plant will be built first.

MACHINE TOOL REQUIREMENTS.

The Grand Trunk Railway System has issued a list of machine tool requirements for delivery to the Port Huron, Mich., Shops, as follows:—

1—Bridgeport double head axle lathe.

2—42-inch car wheel boring machines.

1—American Tool Works Co. 6-foot plain radial drill, high speed.

1—54-inch Colburn new model boring mill.

1—Westinghouse, triple valve testing rack.

1—acetylene autogenous welding outfit.

1—steam-driven air compressor, 1,000 cubic feet free air per minute, Blaisdell or equal.

1—20-inch back geared wheel and lever feed drill press, power feed, automatic stop.

1—14-inch ball bearing sensitive drill press, Henry & Wright or equal.

1—42-inch steel tire coach wheel lathe.

1—50-horsepower, reversible, variable speed, direct-current motor.

2—5-horsepower motors, as above.

1-double machine punch and shear combined, 18-inch throat.

2—Davis expansion boring tools, 8½-inch.

Brantford, Ont.—James E. Walsh, general manager of the Power Plant Supply Co., of Detroit, and representing the Canadian Crate and Supply Co., has written to the city council expressing a desire to open a plant in Canada, and requesting information relative to the industrial standing of the city.

Fort William, Ont.—The Dowswell Sheet Metal Works of West Fort William have completed arrangements to extend their plant back forty feet, the present site occupying the corner of Ford and Brock streets. Their purpose will be to manufacture a sanitary closet, a modern device to be placed in homes that have not plumbing or sewer connections within.

London, Ont.—W. Barnett, Montreal, electrical engineer of the Grand Trunk, was here on Wednesday, February 11, to discuss with General Manager Glaubitz a contract to supply hydro-electric power for the G. T. R. carshops. It is expected that the company will take from 500 to 1,000 h.p. eventually. The whole system will be changed in the east end shops if an agreement can be arrived at.

Galt, Ont.—The Shurly & Dietrich Co., whose saw and bedstead plant was destroyed by fire last week, carried insurance of $80,000, which will cover not more than one-third their loss, if that much. The company were proceeding with a new plan for rewriting their insurance, and had only got fairly under way when calamity overtook them. Mr. Dietrich, it is understood, intends to rebuild.

Sault Ste. Marie, Ont. — The general manager of the Algoma Steel Corporation, Ltd., advises that they are adding two open hearth furnaces to their plant, bringing the total number of furnaces in the open hearth dept. to seven. The Hamilton Bridge Co. secured the contract for extensions to building. The major part of the work connected with the furnaces will be done in the company's own shops by their own men.

Goderich, Ont. — The American Road Machinery Co., of Canada, Ltd., manufacturers of crushing, road-building and contractors' machinery, will start the erection of an up-to-date new plant shortly, 400 ft. long and 110 ft. wide, with 70 ft. runway for electric cranes. The latest ideas in design will be embodied. It will be of steel skeleton construction, concrete curtain walls and modern fireproofed roof. Electric power wil be used throughout and a vacuum heating system will probably be installed. An up-to-date line of machinery is to be installed in the plant.

Niagara, Falls, Ont.—The Canadian Automatic Parcel Checking Co., recently incorporated, with a capital of $200,000, are making arrangements with the Davis Acetylene Co. to manufacture their parcel-checking lockers in this city. The president of the company is Mr. Ballou, who is general manager of the Menasha Paper Co. and a director in the Minneapolis, St. Paul and Sault Ste. Marie Railway. The cabinets, which are to be manufactured in this city, have from eight to 18 lockers, each locker being large enough to hold suitcase, grip, overcoat, etc.

Electrical

Buckingham, Que. — The municipal council are contemplating the installation of an electric lighting system.

Burford, Ont.—The ratepayers of the village wil vote on March 9 on a by-law to authorize the council to contract for hydro power for the municipality.

Walkerville, Ont.—The Heinze Electric Co., Lowell, Mass., it is reported, will build a branch plant here for the manufacture of electric motors, etc.

Wilkie, Sask.—It will be some months before the town of Wilkie is in a position to submit a by-law and make the contemplated extensions to their power plant.

Lacombe, Alta.—A contract has been awarded to the Canadian General Electric Company for a 100 k.w., 2300 volt, 3-phase, 60-cycle, 277 r.p.m. engine driven generator.

Medicine Hat, Alta.—The city council included in their estimates the sums of $10,000 for electrical distributing system, and $20,000 for street lighting purposes.

Coteau Landing, Que.—La Compagnie Electrique de Saint Polycarpe, Limited, has been incorporated with a capital of $20,000, with head office here, to carry on business as electrical engineers.

Fort William, Ont.—The Canadian Car & Foundry Co. are using electric power at their new plant here. The amount at present developed is 300 k.w., but 2,000 k.w., will ultimately be developed.

Hamilton, Ont.—The Dominion Power and Transmission Co., have bought machinery from the Canadian Westinghouse Co., to the value of over $270,000, and another contract has been let for over $360,000 worth. The frame of the new power building has been constructed, and the bases for the machinery built.

Saskatoon, Sask. — The Northland Milling Co. will erect a transmission line from Saskatoon to Factoria, costing between $15,000 and $16,000, of which the city would only be asked to pay $6,000. The proposed line would carry 2,200 volts, and would deliver 350 k.w.

Sydney, N.S.—The fire commission has decided to recommend the installation of storage batteries at the central fire station for the alarm system in place of the present gravity system. The proposal to place police call boxes around the city was referred to the police commission.

Fort William, Ont.—The Mount McKay and Kakabeka Falls Railway Co. is planning to electrify the road, and make further extensions into the country. If it be determined to electrify the railway, a regular service will be given connecting with the city at some point, and power will, for the time, be obtained from the Kaministiquia Power Co.

Kingston, Ont. — The Napanee Improvement Co. have made a proposition to the Kingston council regarding the supply of cheap electric power from a suggested development at a point known as Third Depot Lake where there is said to be from 1,000 to 2,000 h.p. available. The communication was made to the council through A. W. Benjamin, of of Yarker.

Woodstock, N.B.—The county councillors have given consent to the Maine & New Brunswick Electric Power Co. to erect their 30,000 volt transmission line through the township to the town of Woodstock. This company develop power at Aroostook Falls, N.B., and will supply power to the municipalities along their new transmission line, and in Woodstock.

Winnipeg, Man.—Sir. Wm. Mackenzie made two important announcements here last week in regard to future developments by his companies. The first was that the C.N.R. expected to proceed at once with the construction of the new line to Victoria Beach and Grand Marais, and the second was that the Winnipeg Electric is preparing to go ahead with the work of developing the power site at Big Bonnet Falls.

Toronto, Ont.—Expenditures approximating between two and three million dollars are involved in the construction programme of the Hydro Electric Power Commission for this year. In addition to the duplication of the trunk lines of the Niagara system from Dundas to Niagara Falls, which will cost about $700,000, a 46,000 volt line from the Falls to Welland is to be immediately built of extra heavy construction at a cost of $400,000.

Cobalt, Ont.—The work of installation of machinery at Fountain Falls by the Northern Ontario Light and Power Co. has been delayed by the non-arrival of electrical apparatus from the manufacturers. The wheels are being placed in position, but the generators have not been shipped. It is expected that in March an additional 3,500 horse-power will be available to the mines in the Cobalt camp from this new power plant. The transmission line, two miles in length, connecting with the line from Hound Chutes to the camp has been completed.

Winnipeg, Man.—The announcement was made last week by the Winnipeg Electric Railway Co., that the directors of the new Winnipeg Power Co. would put engineers to work immediately to do preliminary exploration work, make surveys and prepare plans to develop electric energy at Great Bonnet falls. These falls are said to be capable of producing 150,000 horse power of electrical energy at a very low cost per horse power. In view of the fact that the Winnipeg Electric Railway Co.'s water power plant at Lac du Bonnet, with a capacity of 30,000 horse power and its auxiliary steam plants in the city of Winnipeg with a capacity of 18,000 horse power are being utilized to their full extent, the necessity of the immediate development of the new falls is apparent.

Regina, Sask.—The total capital expenditure for light and power purposes this year is $404,000, more than half of which will go to complete the equipment of the new power house. The capital expenditure necessary in the light and power distribution system of the city year will total $160,000, made up as follows:—

A 1,200 k.w. motor converter	$ 23,000
Street lighting extension	25,000
Poles and cross arms	9,000
Primary feeder wiring	28,600
Pole line hardware	4,200
Secondary wiring	15,500
Service wiring	3,500
Fire alarm wiring	1,000
Transformers	13,200
Meters	22,000
Motor truck, service, truck and runabout	3,000
Sundries	2,000
Debenture charges, etc.	10,000
	$160,000

Municipal

Dundas, Ont.—The town will shortly be in the market for one auto combination hose and chemical truck.

Owen Sound, Ont.—The town council will build an ammonia concentrator in connection with the municipal gas plant. The cost will not exceed $1,500.

Chatham, Ont.—It is announced that the Union Natural Gas. Co. will shortly start work building a 10-inch gas pipeline from the fields in Tilbury East and Romney Townships to Windsor.

Galt, Ont.—The city council will place a modern fire alarm system at the service of the fire department. A plan for a general improvement of the existing fire protection service, including a steam fire engine, will be studied and adopted at an early date.

Port Arthur, Ont.—A deputation comprising the mayor, city engineer and several aldermen, were in Toronto last week in consultation with P. H. O. McCullough, regarding the new waterworks and sewerage systems. The by-law, which will be submitted, calls for an expenditure of $800,000 upon an up-to-date and efficient system.

St. Mary's, Ont.—The Water, Light and Heat Board has instructed the secretary to write to a number of towns to try and dispose of the steam pumps, condenser pumps, etc., also to dispose of some 75 boiler flues. The superintendent was also instructed to put the boilers of the power house in good condition.

Regina, Sask.—The new reservoir which is to be built within the city limits to hold a reserve water supply of 5,000,000 gallons for emergency purposes, will be 26 feet in depth, about 11 feet of which will be below the surface of the ground. There will also be a 42-inch main between the tank and the power house.

St. Thomas, Ont.—Work has been completed on the steel water tower to be used in connection with the city water works system. The tower is the largest steel structure of its kind in Canada, having a capacity of 500,000 gallons and a height of 144 feet. It cost $25,916, and is part of the $100,000 improvements being carried out in connection with the plant.

MACHINERY EQUIPMENT REQUIREMENTS, THE NATIONAL CASH REGISTER CO. PLANT, TORONTO

Boiler House—Three 325 h.p. boilers, equipped with Murphy stokers. Water heater for hot water heating system. Motor-driven hot water impellers and air compressor.

Brass Foundry—16 coke furnaces with underground method of removing ashes and refuse. 5 moulding machines. 1 circular table for carrying finished moulds. 2 double polishing lathes. Band saw and acid dipping tank for brushing and dipping department.

Machine Shop—2 Lincoln type millers, 2 high-speed duplex millers, 3 plain millers, 1 hand miller, 2 two-spindle profilers, 10 multiple spindle drills, 1 riveting machine, 2 tapping machines, 1 30-inch power shear, 1 centering machine, 1 plain grinder, 1 hand screw machine, 2 automatic screw machines, 4 power punch presses, 1 drop hammer, 1 high grade air compressor.

Tool Room—1 No. 2 Universal milling machine, 1 16-inch shaper, 3 floor lathes, 2 bench lathes, 1 Universal grinder, 1 surface grinder, 1 cutter and reamer grinder, 3 drill presses, 1 planer.

Polishing Dept.—8 double spindle polishing lathes, under-driven type. Plating plant.

Assembling Dept.—6 drill presses of the Sensitive type, 2 engraving machines, 1 filing machine, and 1 bench lathe.

Power Equipment—Electric motors aggregating 200 h.p. will be used.

General Industrial

Brantford, Ont.—A. G. Spalding & Bros., contemplate building a factory here next year for making sporting goods.

Ford, Ont.—John Stodgell, Walkerville, will erect a building here to be used by the Beeson Non-Skid Tire Band Co., who will manufacture automobile accessories.

Edmonton, Alta.—It is reported that during the next few months the Swift Canadian company will erect some new buildings to enlarge their plant to keep pace with the rapid development of the packing business.

Port Mann, B.C.—It is announced that the Imperial Car Co., Pittsburgh, will commence operations here by March.

Quebec, Que.—A fire here on Feb. 11 in the tannery of Edgar Clement, on Arago street, did damage to the extent of about $10,000.

Walkerville, Ont.—The Peninsular Chemical Co., of Detroit, is contemplating building a factory in Walkerville in the spring.

St. John, N.B.—The factory of Mark Fisher, Sons & Co., has been destroyed by fire. Loss to building $25,000, was covered by insurance.

Lachute, Que.—A fire on Feb. 10 completely destroyed the ropewalk of Thos. W. Bannerman, the loss being from $50,000 to $60,000. The factory was a four-storey stone building.

Caledonia, Ont.—Work was started last week on the new plant of the Laurentia Milk Company, to replace the one recently destroyed by fire.

Port Haney, B.C.—W. J. Graham intends to erect an up-to-date brick making plant with a capacity of 500,000 bricks the first year. He will start at once.

Edmonton, Alta.—The Great Northern Tannery Co., Ltd., N. Edmonton, proposes to double the capacity of its plant. New machinery will be required.

Beamsville, Ont. — Messrs. Reid & Piott have purchased a mill at Canboro, and will later install a peeler there so as to manufacture basket material, which will be shipped to Beamsville to be made up.

Woodstock, Ont.—A. Huntley, manager of the William Neilson, Ltd. plant at Beachville, announces that the Toronto company had decided to build a new $30,000 factory at Beachville, and that work will start on the building in the spring.

Toronto, Ont.—A permit has been granted for a new factory to be erected by H. S. Kaplan in trust, at 41 Wolseley street, in the rear of 72-74 Euclid avenue. The building will be two storeys in height, of brick construction.

Hamilton, Ont.—A site has been chosen in the east end by the Fox Chain Co. for their new plant here, for the manufacture of tire chains. Operations will commence in the Spring, work to be provided for 75 hands. Thomas Crosthwaite is a director.

Prince Rupert, B.C.—The Imperial Oil Co. will construct five large oil storage tanks, which together with necessary office building and warehouse will cost over $200,000. The company will erect five steel and concrete tanks, two having a capacity of 35,000 barrels each, and three others of 10,000 barrels each.

Montreal, Que.—The Abitibi Pulp & Paper Co. proposes to proceed with the construction of a four-machine news plant of approximately 220 tons daily capacity, a sulphite mill of 60 tons capacity, and to bring the capacity of the present ground wood mill up to 225 tons per day.

Fort William, Ont. — William J. Hauser, sec.-treas. of the Detroit and Algoma Mining Co. at Pearl, east of this city, has advised local stockholders that he has purchased a stamp mill and gas engine. He recommends that a crusher and smelter be added to the equipment of the mine.

New Toronto, Ont.—The Brown Copper and Brass Rolling Mill Co., makers of brass and copper rods, whose plant has been closed down for about a year and a half, and was burned, have rebuilt and newly equipped it, and have started operations again.

Hamilton, Ont.—The Canadian Sewer Pipe and Clay Products Co. has been incorporated with capital of $150,000. Lawrence Spittal, John H. Slater, David New, Alexander M. Lewis and Harriston Arrell are provisional directors. The company will locate west of the high level bridge, and will manufacture all types of fire brick and sewer pipe.

Guelph, Ont.—The Libby, McNeill & Libby Co., of Toronto, with head office at Chicago, who had a factory in Toronto which they had to vacate, have decided to locate in Guelph and will take over the building owned by the city and formerly occupied by the Rowen Ogg Shoe Co. They will manufacture all kinds of pickles, sauces and preserves.

Medicine Hat, Alta.—The Carlyle Creamery Co. are now installed at 715 Ottawa St. in their temporary quarters. They expect to build a modern building as soon as the weather permits and will install one of the most complete and modern creamery plants in the West with a pasteurizing plant to supply the city with absolutely pure milk.

Cayuga, Ont.—Messrs. Reid and Metcalf, of Toronto, have purchased the interest of the insolvent Menzie Rubber Co., and will commence operations this week. They have purchased all the present equipment, and will add additional machinery, comprising dipping racks, vulcanizer, mill, and forms at a cost of $2,500. Mr. Reid is assistant manager of the Seamless Rubber Co., Toronto, and Mr. Metcalf was connected with the Dunlop Rubber Co.

Sarnia, Ont.—The foundations of the ten large stills for the Imperial Oil Co., which will be used to manufacture motor spirit have been completed as well as the foundations for the condensers in connection with the stills. The large underground tanks which are needed to store the new spirit are also ready. These tanks are three in number, and will hold about 10,000 barrels each. The company is also at work on a new acid house and on the river road is building several large stills.

Wood Working

Owen Sound, Ont.—The Keenan Woodenware Co. are building a large addition to their factory.

Newmarket, Ont.—Thos. Laws has opened a new woodworking shop on Raglan St. and has installed a gasoline engine.

Norton, N.B.—D. P. Lewis' saw mill at Bellisle Creek, was partly destroyed by fire last Friday night. He had no insurance.

Strathroy, Ont.—The contract for the erection of the Canadian Handle factory will be let immediately after the passing of the by-law this week.

Port Haney, B.C. — C. T. W. Piper, Burnaby, is negotiating for a site east of the Haney Brick Co. Works, for the erection of a shingle mill.

Kingston, Ont.—J. L. Whiting and Mr. A. Chadwick, manager of the Frontenac Lumber and Coal Co., will enlarge their docks in order to accommodate large vessels and erect a coal elevator. It is also possible that a factory will be built by the same concern for the manufacture of woodwork of various kinds.

Chatham, Ont.—W. & R. Walsh have prepared plans for the erection of a new woodworking sash and door factory. The new building will be 60x100 feet and two storeys in height. The firm will branch out largely in lines not at present much developed by the woodworking factories of this vicinity.

Vancouver, B.C.—Work is under way on the construction of a shingle mill for the Robert McNair Shingle Co. on the foreshore of D. L. 349 in Port Moody, B.C. The mill will have a capacity of 350,000 shingles per day. It will be a twelve machine shingle mill, will employ fifty men, and will give employment to about twenty-five more in the limits from which it will draw its shingle bolts. It is estimated to cost $100,000. The building itself measures 90 ft. by 200 ft., and the kiln is to be 96 feet wide by 220 feet long. Provision will be made for engine rooms, storerooms, boiler houses, shops and sheds. David Cook is in charge.

Catalogues

Electric Hardening Furnaces are dealt with fully in a bulletin, No. A4066, which we have received from the Canadian General Electric Co., Toronto. Illustrations include sectional and outside views of the furnace, and diagram of electric circuits.

Wilmarth & Morman Co., Grand Rapids, Mich., have issued new price lists covering some lines of grinders which they manufacture, the principal being No. 1 surface grinders, Style B, combination cutter, reamer and drill grinders, and electrically-driven drill grinders.

The Canadian General Electric Co., Toronto, have issued bulletin No. A4185 dealing with single-phase induction motors, type KS. A full description is given of this motor with detailed illustrations. One page shows a diagram of the motor with a table giving the principal dimensions and weights for the different sizes.

Drop-forged Clamps are dealt with fully in a bulletin recently to hand from J. H. Williams & Co., Brooklyn, N.Y. The "C" clamps are made for a full range of service, a description being given of each type, together with tables detailing the principal dimensions and price of each size. Other styles of clamps are also described fully.

The "Morris" Q.E.F. runways are illustrated in a bulletin recently received from the Herbert Morris Crane & Hoist Co., Ltd., Toronto. The illustrations which are very clear, show runways installed by the company and indicate the ease with which materials can be moved around a plant. Copies of this pamphlet will be sent to interested readers on application.

The United States Electrical Tool Co., Cincinnati, O., have sent us a pamphlet containing particulars of their portable electrically-driven drills and grinders. The illustrations show the various types of tools and the work for which they are adopted, also views of the drills being operated. The "Universal" motor drill is also described and illustrated, mention being made that these tools can be made for either A.C. or D.C. current.

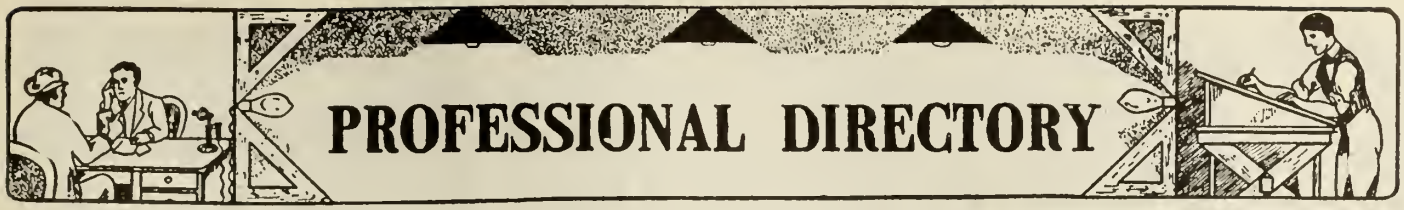
Electricity in Iron Foundries is the title of a bulletin, No. A4167, which the Canadian General Electric Co., Ltd., Toronto, have published. The bulletin contains illustrations of a number of electrical installations in foundries, such as crane drives, storage battery locomotives, motor-driven blowers, air compressors, fans, conveyors, etc. The reading matter deals with the subject in a clear and comprehensive manner.

The Simplex Manual, new edition, published by the Simplex Wire & Cable Co., Boston, is ready for distribution (free) to anyone who asks for it. The 92 pages are full of tables and other information of all sorts about insulated conductors and matters electrical, and are served by a very complete index. Printed on a fine, thin paper, and bound with stiff covers, this booklet "just fits the pocket." Every electrical man having anything to do with wiring problems needs a copy.

The Johnson Temperature Regulating Co., of Canada, Toronto, have issued two pamphlets dealing with the "Johnson" system of temperature and humidity regulation. The system is described in detail, as are also the thermostats and other equipment installed in the system for various services. The illustrations include diagrams of systems, views, of thermostats, diaphragm and reducing valves, also of numerous buildings equipped with the "Johnson" system.

Boylston Steam Specialties are dealt with fully in Catalogue No. 10 which we have received from the Boylston Specialty Co., Chicago. The apparatus listed covers a full line of fittings for steam heating systems, such as valves, regulators, traps, etc. Each type of fitting is illustrated and described, while several pages are devoted to useful information covering heating systems and properties of steam. An interesting piping lay-out is included showing the location in the system of the various fittings listed.

The Curtis Pneumatic Machinery Co., St. Louis, Mo., have sent us a copy of their new catalogue No. 62 which deals with the extensive line of air operated equipment which they manufacture. The principal lines treated are air compressors, air hoists, run-way systems, elevators and cranes. Each class of equipment is fully described and illustrated, special reference being made to their principal characteristics. Several tables are included in the air hoist and compressor sections giving the principal dimensions for each size. Copies may be had by writing.



Peebles Alternating Current Motors is the title of a pamphlet No. 22A recently issued by Bruce Peebles & Co., Ltd., Edinburgh, Scotland. The pamphlet is divided into two parts, one dealing with open type machines and the other with a self-contained type, both types being polyphase induction motors in large sizes. A general specification is included, while illustrations give a general idea of the design. In addition, there are a number of tables giving the principal dimensions, weights, H.P. and other data covering the various sizes. The pamphlet concludes with a list of customers and a list of foreign and colonial agents.

Book Reviews

The Canadian Peat Society, Ottawa, have published their quarterly journal devoted to the peat industry and its advancement. The journal contains articles on peat moss, Canada's peat industry, the "Moore" gas producer, etc., also editorial comments on various matters relating to the peat industry, by-products obtained, and possibilities for development. The journal contains a number of illustrations of operations at Alfred, Ont.

Locomotive Boiler Construction. By Frank A. Kleinhans, with additions by G. L. Fowler, 478 pages; 350 illustrations; 40 tables; five folding plates. Published by Norman W. Henley Publishing Co., New York. Cloth, price, $3.00 net. This book is, as the title indicates, a practical treatise on locomotive boilers, dealing with modern methods of construction in all its phases, from the laying out of the sheets to the completed boiler. With the exception of the introductory chapter on boilers in general, it is devoted entirely to the locomotive type of steam generator, the succeeding chapters dealing with laying out work, flanging, punching, riveting, etc., all the various processes being dealt with in detail as far as it is possible to describe such operations within reasonable space. The chapter on laying out boiler sheets is of necessity rather complicated, but should be readily understood by those familiar with this class of work. Diagrams showing the development of each sheet are given, the figures being clear and easily followed from the reading matter. The following chapters deal successively with flanging, punching, shearing, plate-edge planing and bending, drilling and riveting, etc. Flanging is treated at some length and there are a number of descriptive illustrations showing the various operations. Fire box, smoke box, front-end details and boiler fittings are dealt with in other chapters, while one is devoted to boiler shop machinery. In the latter part of the book, there are a number of general and mathematical tables and a considerable amount of valuable data for boiler makers. There are also chapters on locomotive boiler inspection and a series of questions and answers. Five folding plates are included of cross-sectional drawings of boilers on a reduced scale. This is a good practical treatise for boiler makers and inspectors, and should be highly serviceable to those engaged in the production of locomotive type boilers.

Questions and Answers relating to modern automobile design, construction and repair, by Victor W. Page, M.E. 608 pages, 6x9, 329 illustrations, 5 folding plates. Published by the Norman

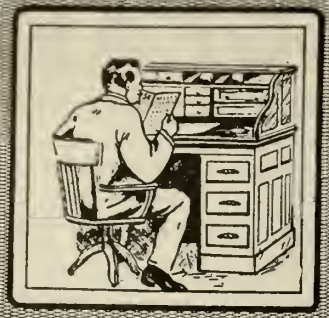
81 PETER ST. TORONTO
PHONE ADELAIDE 1031

W. Henley Publishing Co., New York. Price $1.50 net. This is a practical treatise on the automobile consisting of 36 lessons arranged as a series of questions and answers, each lesson covering a distinct part of the machine. It is an entirely new work, and while being complete in itself, can be used as a supplementary to "The Modern Gasoline Automobile," by the same author. This later book while being more elementary than the author's previous work, will be found to contain a great deal of valuable information for motorists, presented in a clear and intelligent manner. The various parts of the automobile are taken in turn, and the questions and answers arranged so as to give the necessary information in a logical and concise manner. The illustrations are numerous and exceptionally clear, the designs being in accordance with modern practice, each part being clearly indicated by means of arrows. The book contains in the concluding chapter some useful information on car operation, winter driving, a digest of motoring laws and Canadian regulations. This work will be extremely useful for motorists and the arrangement by lessons should make it a desirable text-book for automobile classes. It is written in simple language and should be intelligible to all.

Lofty Cantilever Bridge.—A lofty bridge of the cantlever type has recently been completed for the National Railways of Mexico over the Rio Chico on a new line between Durando and Llano Grande. It was planned at first to build a steel viaduct over the ravine, but later the engineers decided to construct a single track cantilever bridge. This structure has anchor arms, 105 feet long, and cantilever arms, each 135 feet in length, carrying a suspended span of 120 feet. The total length of the bridge between back walls is 701 feet 6 inches. The base of the rail is 244 feet above the bottom of the ravine.

CONTRACT WORK, FORGING



THE SUDBURY CONSTRUCTION & MAchinery Co., Ltd., Sudbury, Ont., have an inch and a half upsetting and forging machine they require for their own use about five hours per day. They wish to run this machine day and night and invite correspondence from users of forgings who are looking for an interesting proposition. (10)

Cable Address: Cook, Hartford, U.S.A.

Asa S. Cook Co:

Hartford, Conn.

We manufacture Rivets of every description, ½ inch dia. and smaller.

PARMENTER & BULLOCH CO., LTD.

GANANOQUE, ONT.

RIVETING COSTS REDUCED BY "TOLEDO" WELDERS

No. 154 Welder, 36-in. Throat

The large daily output of many manufacturers of automobiles and auto parts has been made possible by the use of the "TOLEDO" Electric Welder shown here. With the increased output of their products, **costs have been reduced from 60 to 95%.**

We will prove this by shipping you a "TOLEDO" on 30 days' trial.

Write for our new Bulletins, Nos. 14 and 15. They tell all about "TOLEDO" Butt Welders and Spot Welders.

No Lease. No License. No Royalty.

ACCURACY

The discriminating buyer is one we like to meet—the one who insists on accurate product. He will eventually buy "Galt" Cap and Set Screws because they measure up to his standard.

Your rush orders for S. F. Hex. nuts taken prompt care of. Better finished nuts — try a sample.

ALEXANDRIA, ONT.
Toronto Office, 249 Victoria Street

Keyseater and Slotter

Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

Baker Brothers, Toledo, Ohio.

16 in. Lever
POST DRILL

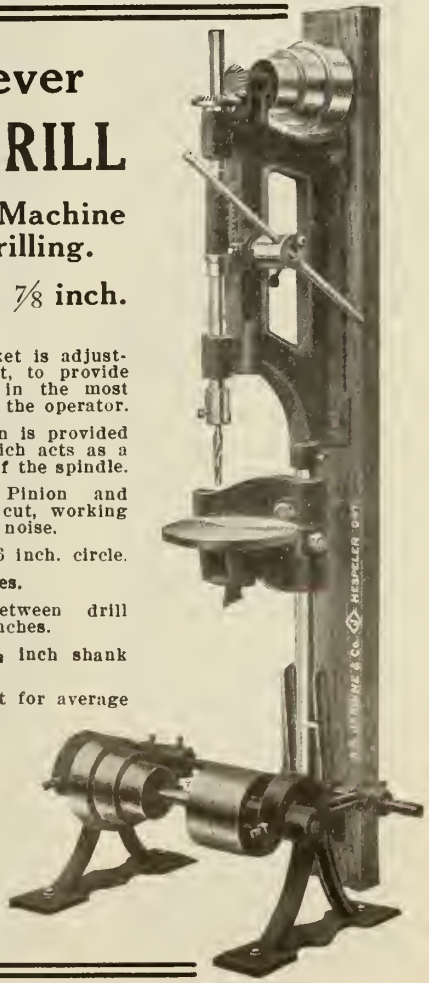
A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.



Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

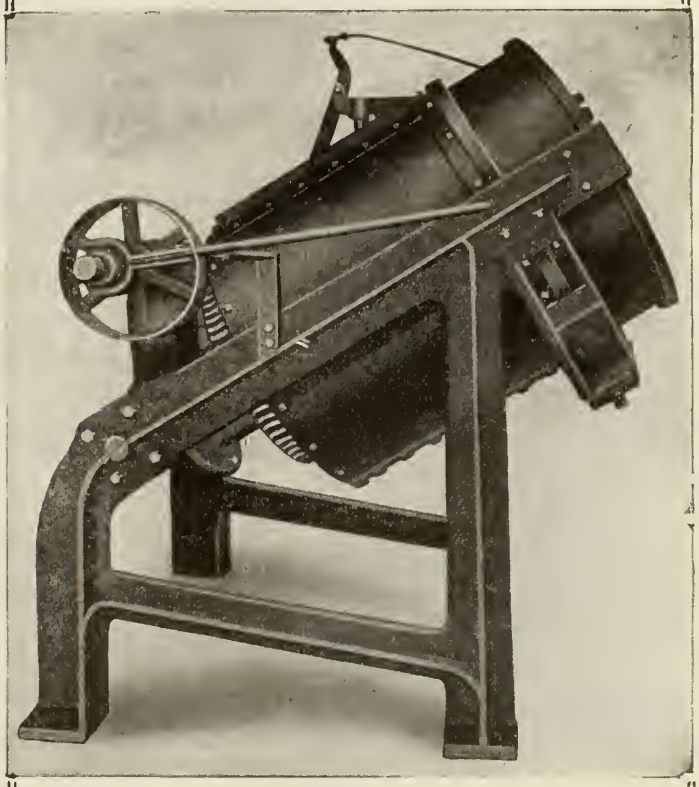
Whiting Cranes

meet all requirements of safety and accessibility. Designs for every practical service. Only highest grade of standard electrical equipment used, insuring dependable operation and perfect control. Large safety factors provided in all parts. Simple, substantial construction throughout.

Send for Catalog

Complete Foundry Plants



WHITING FOUNDRY EQUIPMENT CO. HARVEY-ILL. U.S.A. CHICAGO SUBURB.

Cranes of All Kinds.

The "No-Wear" Nozzle

An exclusive feature of the

"Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

STEEL CASTINGS

Of the Highest Prevalent Quality

We make perfect castings at a price that is right.
NEW PROCESS CONVERTER STEEL CASTINGS, annealed and unannealed.
We also make CHROME-MANGANESE AND NICKEL STEEL CASTINGS.
Any size from quarter lb. to 30,000 lbs., absolutely guaranteed.
GET OUR ESTIMATES.

JOLIETTE STEEL CASTING WORKS, Ltd.

Head Office and Foundry: *JOLIETTE, P.Q.*

Casting for a 10,500 H.P. Mater Wheel

High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption Cost of repairs reduced. Eliminates heavy shocks and vibration.

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

No. 4 Capstan Lathe

WITH PATENT CHASING SADDLE AND AUTOMATIC FEEDS TO CAPSTAN.

Height of Centres	6½ in.	Swings Over Saddle	6¼ in.
Admits Through Spindles	2 in.	Working Stroke of Capstan	8½ in.
Admits through Draw-in Chuck	1⅝ in.	Approximate Net Weight	2,500 lbs.

The ideal machine for small, duplicate work from Bars, Blanks, Castings or Stampings. It is particularly adapted to the economical production of parts requiring large external or internal threads, or threads requiring an unusually high degree of accuracy.

The spindle may be started, stopped or reversed instantly by the horizontal lever on top of the head stock.

Patent Automatic (draw-in) Chuck for Bars, or "Coventry" Patent Concentric Chuck for castings is furnished.

Capstan has four positive automatic feeds, changed without stopping, and controlled by six self-selecting trips and dead stops.

Vertical Shaper, Most Useful Tool of its Type

Distinctive Features Give Wide Range of Utility. Can Always Be Kept Supplied With Work

The P. & W. Vertical Shaper will handle the regular line of both slotting machine and horizontal shaper work and is more accurate and adaptable than either of these machines. Furthermore, for finishing dies and machining radial and irregular shapes, it is absolutely in a class by itself.

Built in two sizes—6" and 10".

Swiveling Ram Head enables tool to be set in most advantageous position, also all sides of work can be machined at one setting. In case of two parallel sides, accuracy of parallelism is absolutely assured.

One of the most distinctive features of the Vertical Shaper is the tilting ram bearing. This permits the tool to cut at an angle from the vertical and hence the desired clearance can be readily obtained.

Another advantage of the Vertical Shaper on die work is that when working to a line, the cutting tool always enters the piece where the line is scratched. Thus the line can be accurately followed. Furthermore, this shaper is a precision tool and accuracy, which is highly important in die work, is assured.

Write for new illustrated circular "Vertical Shapers."

Efficient on Shaper and Slotter Jobs

Unexcelled for Die Work

Double in Purpose—

double in the satisfaction its ownership gives you, double in strength and wear-resisting qualities.

Maybe that sounds pretty strong, but it's just about true. For the

"Bemis & Call" Combination Wrench

has proven by the many satisfied users it has made that it's up to all we claim for it.

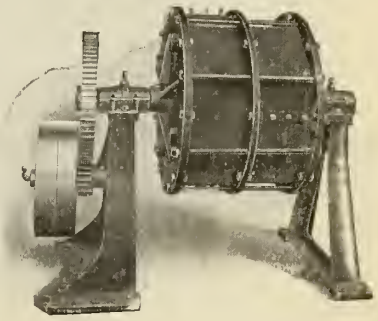
Its forged-steel, case-hardened construction makes it resist wear and tear; its long operating nut makes adjusting it a cinch; and the interchangeable plan on which it is built makes replacements easy.

It's all in our Catalog—Write for it.

TRADE B&C MARK

Bemis & Call Hardware and Tool Co.
SPRINGFIELD, MASS., U.S.A.

The Abbott Way



is the logical way to finish all your small parts.

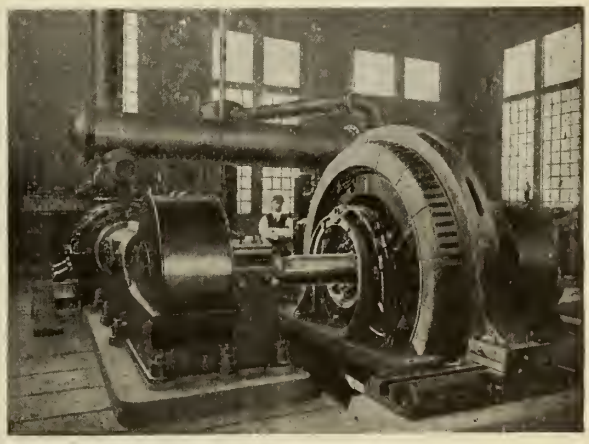
Whether they be of brass, steel, nickel, aluminum or any other material, the carbonized steel balls inside an Abbott Tumbling Barrel will give them a smooth, hard, wear-resisting finish—will make them look better than if they were polished—at a fraction of the cost.

The "Abbott" finishes in hundreds, needs no materials except the glass-hard steel balls—which never wear out—and a little soapy water, and requires but a few moments of an unskilled operator's time.

If you're still finishing by the old methods you're wasting time.

You'd better send us some samples for burnishing and write for our free book.

The Abbott Ball Company



1047 Elmwood Avenue **Hartford, Conn.**

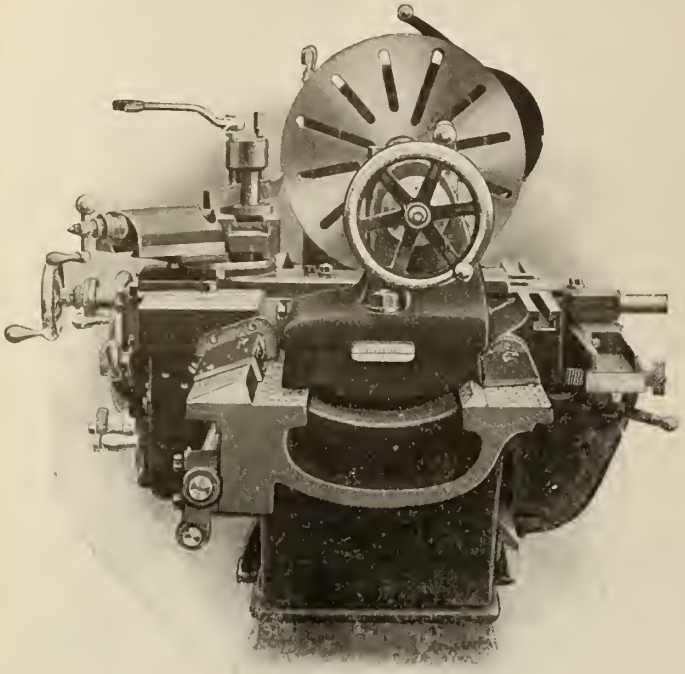
Westinghouse Self-Starting Synchronous Motors form the most Economical and Satisfactory Drive for Compressors.

Economical to Install and Maintain. The motor is direct connected to the compressors. Hence it costs less to install than belted drive and requires less floor space. Transmission losses and belt maintenance expense are eliminated. The first cost of direct-connected synchronous motor-driven compressors of capacities of about 1000 cu. ft. per minute is about the same as that of other types of drive; in larger sizes it is less.

Efficient in Operation. The efficiency of direct-connected synchronous motors is higher than that of any other form of drive.

Furthermore, these motors can be arranged to raise the power factor of the line on which they operate. Better power factor means increase in capacity of generators, transformers, and transmission lines; better voltage regulation; and **often better rates for Central Station power.**

Westinghouse Synchronous Motor-Driving Air Compressor.



Great Reliability. These motors are thoroughly reliable. One large installation of 7,200 h.p. Westinghouse synchronous motors has been driving the compressors of a large Copper Company for several years and has been satisfactory in every respect in spite of wide variations in the operating conditions.

Full information on these motors sent on request.

DESIGNED TO MEET SERVICE CONDITIONS

Heat generated limits the speed of a cutting tool. The **Landis Die** was designed with this end in view. Line contact, natural clearance and flexible rake—all help reduce the friction at the cutting edge. That's why the **Landis Die** excels as a producer.

In one plant eight Landis Machines have replaced thirty-two of another make, and at that are producing more work. Another concern is getting three times the output from our machines that they could procure from the same number of hobbed die machines.

Write for our catalogue No. 21.

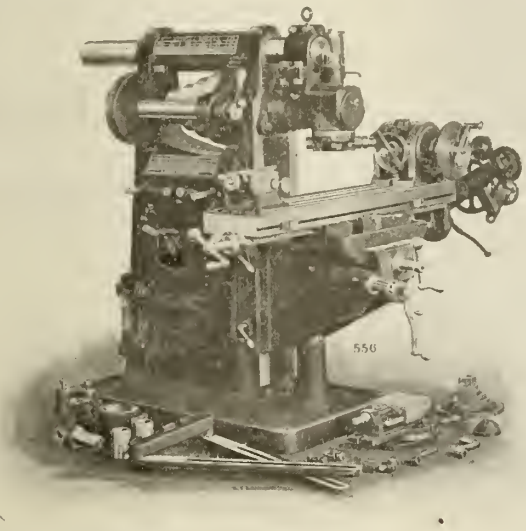
The largest special manufactory for the construction of Boring and Milling Machines



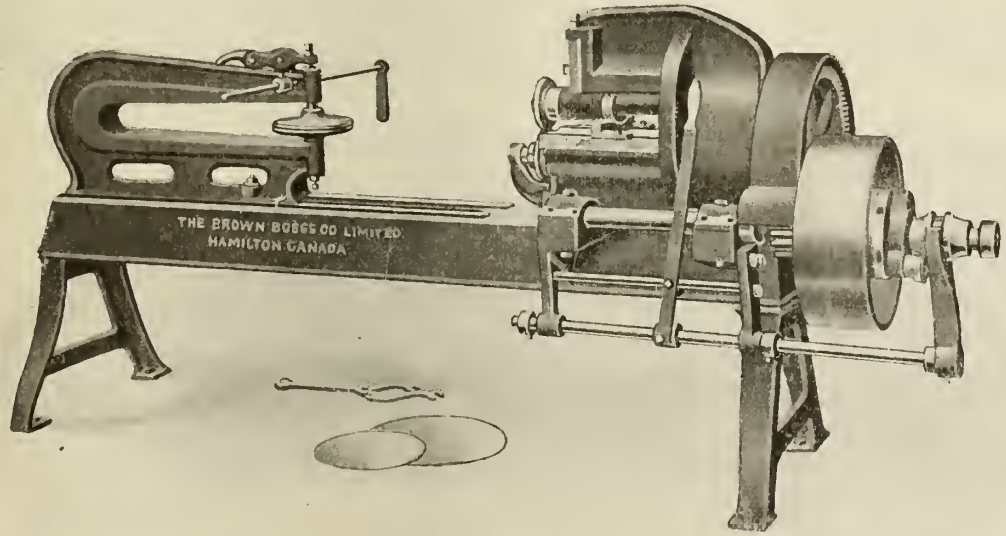
How Much Of The Time Are Your Universal Millers Used For Cutting Spirals?

A PLAIN MILLER fitted with index Centres can do any tool-room job that a Universal can do except cut spirals

Cincinnati Plain Millers can also cut spirals.

The equipment consists of Dividing Head, Driving Mechanism and Spiral Milling Attachment, and will cut spirals of greater angle than any Universal will take in.

But spiral jobs are only occasional, anyhow.



THEN why not install a Plain Miller with Dividing Head for your tool-room work, and when a spiral job comes along, use the attachment?

This makes the ideal tool-room outfit—a Plain Miller for the regular work and a spiral cutting equipment when needed for the occasional job.

In a Cincinnati Plain Miller with tool-room equipment you have both a Plain and a Universal—two machines in one.

The Great Importance of the Tool Room and of its Universal Miller

The tool-making department is the most important in the modern manufacturing plant. All other departments wait on it. The success or failure of any given department rests largely with the tool room.

When the tools to be used in the various manufacturing operations are constructed for producing a maximum output with a degree of accuracy that will insure interchangeability, the product will be low in cost and reliable. The user will have no cause for complaint when it is necessary to order repair parts.

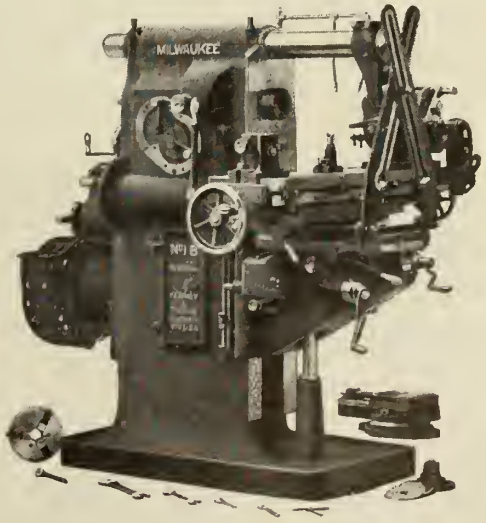
The universal milling machine is the most important machine in the tool room. It is called upon to perform a greater variety of operations than any other machine—probably a greater variety than all the rest of the machines in the tool room put together.

Too much care and attention cannot be paid to the selection of the universal milling machine for the tool room.

Milwaukee Universal Millers, furnished with standard equipment, cover a very wide range of operations. This can be exteuded greatly by the addition of attachments, such as the slotting attachment and Rotary Table (shown above).

The index plates and crank used with the Spiral Universal Dividing Head (standard equipment of Milwaukee Universal Millers), interchange on the worm shaft of the rotary table. In this way dividing can be done on the rotary table just the same as on the centers.

The slotting attachment has an adjustable stroke from 0 to 4", and a quick return of two to one. Tools of any form of shank, either rough or finished, are held in V-block clamps of hardened steel. The ram consists of a rectangular steel bar. The attachment fits snugly on the dove-tail of the column and is practically as rigid as though an integral part of the column. It can be swiveled to any position.



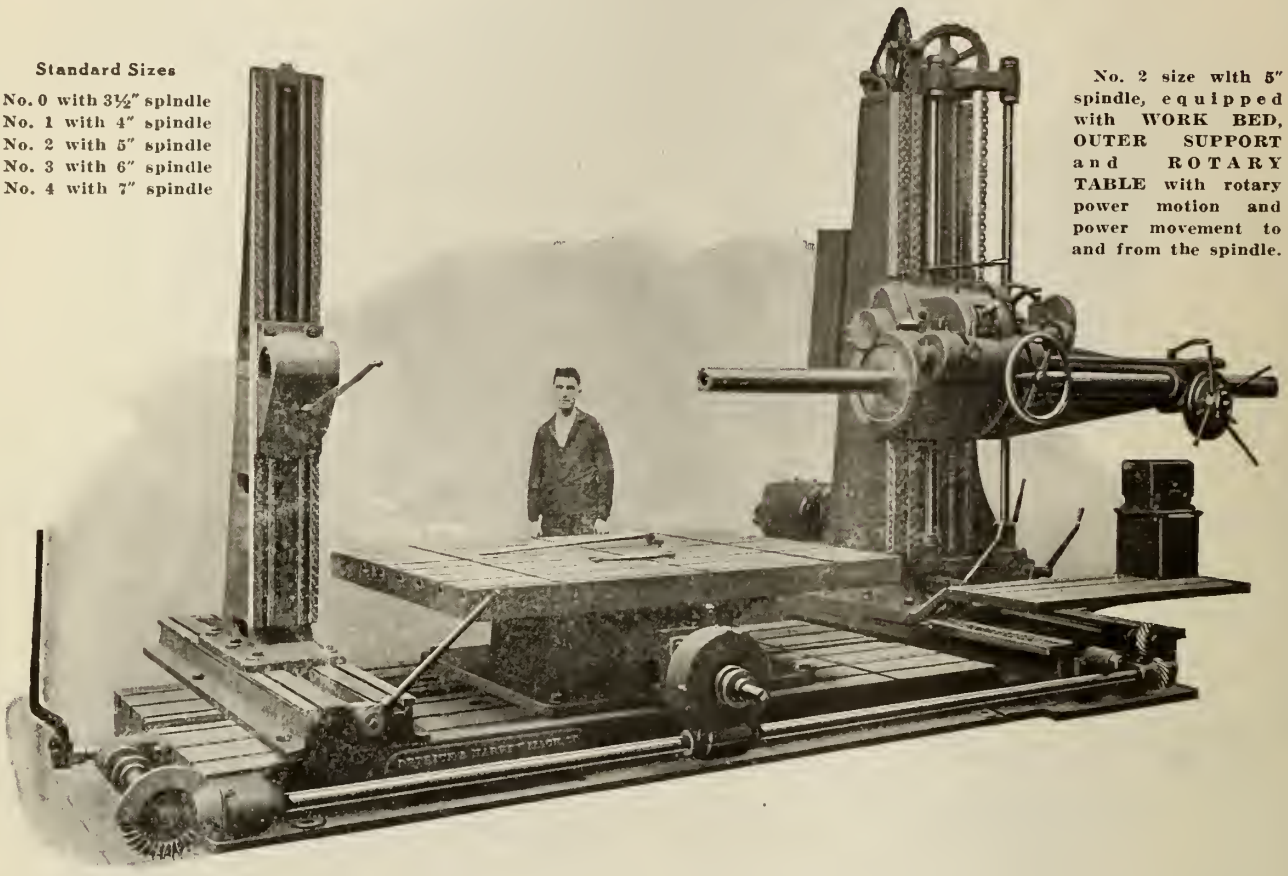
In the illustration it is swiveled slightly to allow draft. The internal gear that is being finished is for a pattern which must have a slight taper to get it out of the sand satisfactorily.

This is but one of the hundreds of operations that suggest themselves from time to time in connection with machines and attachments of this kind.

Milwaukee Universal Millers, with their cascade lubrication, constant speed drive, and convenient location of operating levers, make for maximum output as well as for an extremely close degree of accuracy.

And there is no place where maximum output is more desirable than the tool room, for ofteutimes a whole department, or even the entire plant, may be held up waiting for the completion of certain tools.

The facts about Milwaukee Millers—Plain, Manufacturing, Universal or Vertical—can be had by writing for our Bulletins. Write.



KEARNEY & TRECKER COMPANY, MILWAUKEE, WIS.

Canadian Agents: Williams & Wilson, Ltd., Montreal; Rudel-Belnap Machinery Co., Ltd., Toronto; A. R. Williams Machinery Co., Ltd., Winnipeg.

ALL THE WORK AT ONE CHUCKING

Standard Sizes

No. 0 with 3½" spindle
No. 1 with 4" spindle
No. 2 with 5" spindle
No. 3 with 6" spindle
No. 4 with 7" spindle

No. 2 size with 5" spindle, equipped with WORK BED, OUTER SUPPORT and ROTARY TABLE with rotary power motion and power movement to and from the spindle.

It is far easier, quicker and better to finish the different operations at one chucking than to waste the time and effort transferring the work from one machine to another.

By using the rotary table in connection with our machine you can perform *all the operations* on the different sides of the work, no matter how large or irregular in shape, *without rechucking.*

Valuable Features

1. **Centralized Control.** All movements fast and slow by hand and power are non-conflicting, any feed and traverse, the starting, stopping or reversing of the machine, or changing from one operation to another can be made at the front of the machine.

2. **The Narrow Guiding Fits** of the Column to runway and of saddle to column, reduce the friction of the machine, the strain on the feed mechanism and retain alignment to moving parts.

3. **Additional Friction Device,** for retaining spindle in its horizontal position against the pressure of cut when milling.

4. **No Belts Used.** All gear driving and feeding mechanism.

5. **All Feeds** are driven by the spindle and are always within a given ratio to spindle speeds.

DETRICK & HARVEY MACHINE COMPANY

BALTIMORE, MARYLAND, U.S.A.

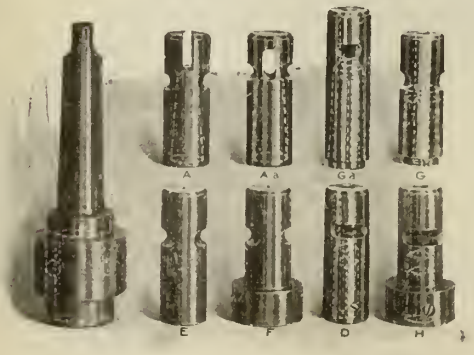
Get a "Modern" Equipment for Your Taper Threading Work

The word "MODERN" stands for Accuracy, Productive Capacity and Durability



The "Modern" Special Taper Threading Die can be used on the ordinary screw machine with hand-operated turret, and is adapted for cutting much special work that would be otherwise beyond the capacity of the machine. It is rapid and accurate in operation, opens automatically at any desired point and returns clear of the thread cut; it will cut close to a shoulder and produce work perfectly accurate.

By the use of the "Modern" Adjustable Hollow Milling Tool, tapers can be turned preparatory to threading, and the work once set, the turning and threading can be carried forward with rapidity and a great saving in time.

Let us estimate on an equipment for your taper threading work!

Every Drill Press User

knows what these are and he also knows from experience how difficult it is to keep up commercial production without the "MAGIC" CHUCK EQUIPMENT. Why: Because this chuck takes any tool and handles any operation that can be done on a drill press—drilling, reaming, counterboring, end milling, tapping, etc., and one tool can be instantly replaced by another without stopping the machine.

Figure out the saving this means in time and labor, and let us send you a Magic Chuck Equipment for 30 days for your test and approval.

SIDE MILLING CUTTER
Carbon and High-Speed Steel

"Detroit" Cutters do not require excessive grinding. They work without strain on the machines. They are mechanically accurate, perfectly hardened and tempered and their use means increased speed and accuracy. See catalogue, pages 103-111 *inclusive.*

CUTTER WITH NICKED TEETH
Carbon and High-Speed Steel

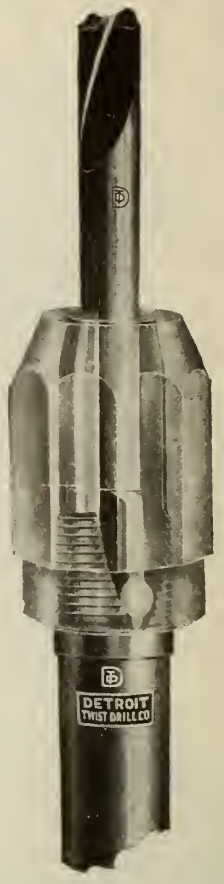
We make a specialty of high-speed and carbon plain and side milling cutters; cutters with nicked teeth; concave; convex; angle; circular cornering and circular cornering, right- and left-hand double.

Standard sizes in stock for immediate delivery; special sizes to order on short notice at special prices.

Write to-day for Catalogue 17-*R. Arranged in two colors for ready reference; black for carbon, red for high-speed steel.*

Where Ordinary Drills Fail

Take those jobs that have put ordinary drills out of business—try some "Detroit" Twist Drills on them and watch the results. Every day and all day, in all kinds of service they are giving increased efficiency and reduced costs in high-grade shops all over the country? Why not in yours?



"Detroit" Twist Drills

are made of the best small tool steel, selected by an expert. We have made a study of the best methods of tempering and we have the best of modern equipment, including electric furnaces. Consequently our tempering processes are the best a scientific age affords.

Some of our workmen and heads of departments have been with us for twenty-seven years and have developed an instinct for accuracy that is almost supernatural.

"Detroit" Twist Drills run perfectly true from tip to shank; they are ground to the 1-2000 of an inch—ground on their centres after hardening—and we guarantee each one. Look for the trademark.

Let us send you some on trial. The test will not cost you a cent if not satisfactory. Write to-day.

GRAHAM GROOVED SYSTEM
OF CHUCKS AND DRILLS

"Detroit" (Graham) grooved shank system of chucks and drills was originated and perfected by the Detroit Twist Drill Company.

It is the simplest, most efficient and most economical system ever devised.

It insures an accurate centre and positive drive for all boring tools and is adapted to all press and lathe spindles without materially increasing their length. It permits the widest range of sizes; quickest adjustments; prevents strains on tangs; insures great rigidity.

Let a test prove it.

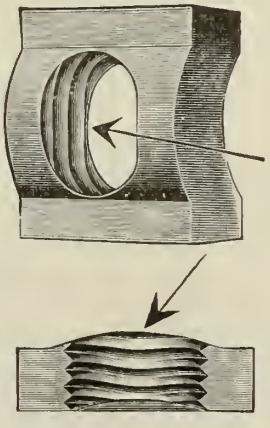
THE TRIMONT MFG. CO. are pleased to announce to the users of Wrenches that *The Trimo* is now being sold as low as the other makes of similar Pipe Wrenches. This is a new feature of the trade, as heretofore *The Trimo* has been sold at a higher price. *Send for Catalog 200.*



GRIP  NUTS

Why Grip Nuts Lock

Each bar of steel has an arch running through the centre of it. The nuts are blanked out and threaded through this arch, after which they are accurately gauged, then deflected by pressure upon the crown of the arch by automatic machinery, thus producing a locking friction upon the threads, as shown in the illustration. Cut No. 3.

All Ready to Wrench in Place

They are all ready to wrench in place and will lock upon a bolt as soon as all the threads of the Grip Nut are engaged. **They do not require to be jammed or sprung.** Good contact is all that is required and they are guaranteed not to injure the bolt threads.

Endorsed by Leading Railroads

Grip Nuts are standard upon some of the leading railway systems of the United States, as well as with most of the important crossing, frog and switch manufacturers and car builders of this country.

Can be Applied to Any Bolt and Will Not Injure Threads

We have engineers in all parts of the Dominion who will call upon you on request and explain the wonderful efficiency of this device, its saving, etc. We also make a holding nut that does both the holding and locking.

Canada Grip Nut Company, Limited

When a B & K pipe machine is installed where other pipe machines are already in service, you will find all the men will want to run it. They can cut-off, ream and thread pipe with the assurance that when the piece is removed from the machine that it will be a good job.

Our machines are designed and built for permanent, high-economy service. The explanation lies in their heavy construction, large bearings and careful fitting. What good is the powerful drive on a pipe machine, if the gripping chucks will not hold pipe?

The Advantage of a

CRAWFORD

Sectional Oven

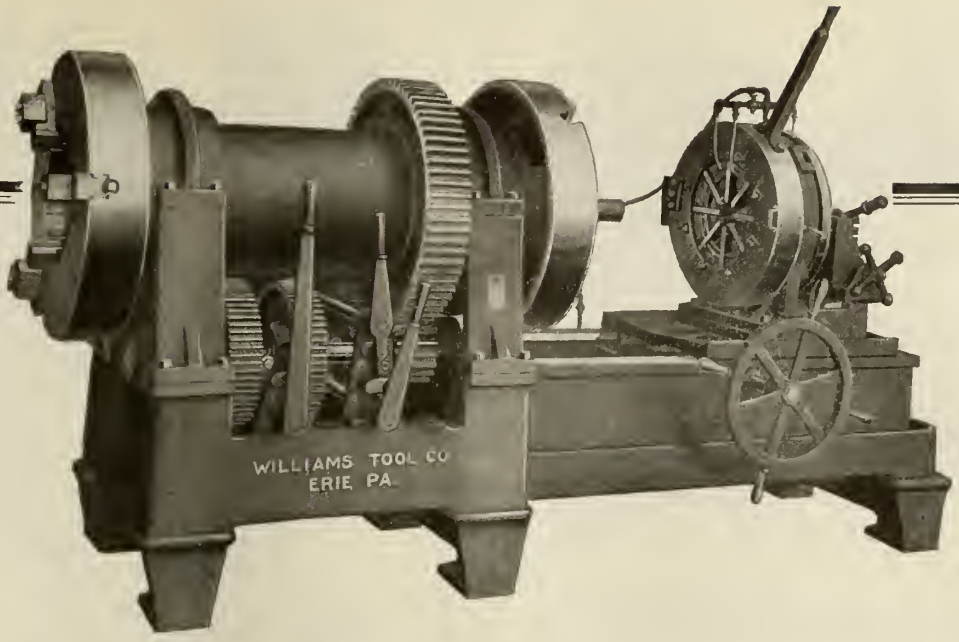
Is Two-Fold

In the first place, you get maximum fuel economy because the burner is adjusted for perfect combustion, while the splendid insulation keeps all the heat in the oven.

In the second place, the oven is so designed that the thorough circulation of air keeps the temperature uniform all over the interior, thus giving accurate results in your product so that you do not have to do the work over again, or to be content with second-rate goods.

Air from a positive pressure blower keeps the gas in the

Enclosed Flame Gas Burner



burning at just the rate needed for proper temperature of the oven, no matter what the atmospheric conditions may be.

Let us send you illustrated folders, "Correct Core and Mold Drying," and "Drying Out Armature Coils."

CORRESPONDENCE A PLEASURE

Sherbrooke Machinery Co., LIMITED
SHERBROOKE, QUE.

BLOWER DEPT

A FULL DAY'S WORK

If you were to figure the proportion of time spent by your employees in forced idleness every day, you would probably find out the reason and remedy it.

A great part of this enforced waste of time is often due to a lack of proper facilities for handling material and work.

By the installation of

Ingersoll-Rand Air Hoists

at certain points in your shop this unproductive cost is greatly reduced.

Ingersoll-Rand Air Hoists will assist your machinists to increase their actual working time—there won't be any time lost between jobs.

The straight-lift air hoist is certainly the cheapest method of making those numerous, quick, short lifts around a plant. It applies the power to the load in the most direct manner, and compressed air is so elastic as to adjust itself to the load without loss of power.

Have you looked through your plant lately to see where you can reduce this non-productive time?

Asbestos Lubricants That Kill Heat

ASBESTOLENE

A lubricant that is manufactured specially to meet the growing demand for a high-grade friction-eliminating substance, one that prevents heat due to friction, and reduces that friction itself to the minimum.

SPEDOLENE

Designed especially for use in connection with Transmissions, Differentials, Universal Joints, Bearings, and all worn gears in Motor Cars or Trucks. Where rapidly-moving parts are to be satisfactorily lubricated, this cannot be equalled.

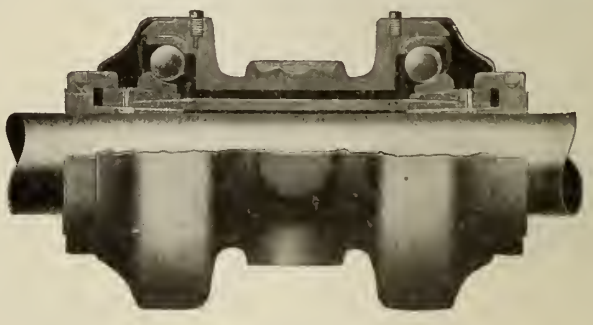
AXOLENE

Is the most economical grease. Where there is a demand for a heavier-bodied lubricant, this meets the requirements perfectly. It does not become hardened with age, it is not affected by atmospheric changes. It meets with general favor as a lubricant where slower speeds are to be encountered.

ASBESTOS LUBRICATION IS THE COMING ELIMINATOR OF BEARING TROUBLES.

The Railway Asbestos Packing Co., Ltd.

Home Office and Factory: Sherbrooke, P.Q. Montreal, 30 St. Francois Xavier St.



YOU CAN INCREASE YOUR POWER WITHOUT INCREASING THE SIZE OF YOUR POWER PLANT

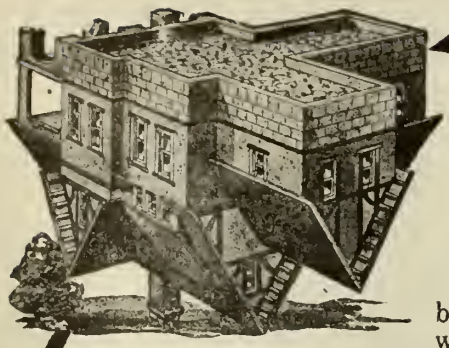
Your present line shafting is consuming from 15% to 60% of your power.

The Chapman Double Ball Bearings will save this waste and turn it into productive energy.

They will also reduce your oiling and attention to a minimum.

They fit any adjustable hanger and the change can be made with but little delay to you.

In use in over 2,000 Canadian Factories



We carry in stock the best grade of Steel Balls.

Make the Roof as Everlasting as the Foundation!

You construct the foundation of your building of stone because you know that nothing can affect stone—know that it will *last forever.*

Now suppose your roof was made of the same everlasting stone as your foundation. What an everlasting fire-proof roofing you'd have!

Then why not put on a *stone* roofing? J-M Asbestos Roofing is a light-weight, flexible roofing that is ***solid stone*** to all intents and purposes.

J-M ASBESTOS ROOFING

is made of several sheets of Asbestos—*stone*—securely cemented together with Trinidad Lake Asphalt—a *mineral.* It is *all* mineral *all the way through.*

Think what it would mean to you if your buildings were covered with J-M Asbestos Roofing. It would mean not only permanence and absolute security from leaks, no matter what the climate or weather; but freedom from the cost and trouble of coating or re-graveling, and positive protection from sparks and burning embers. It would mean that your roofing would *cost you less per year of use* than any other roofing on the market.

Your dealer has this roofing, or we'll sell you direct from our nearest branch.

Asbestos is a peculiar substance, and very interesting. Perhaps you'd like a sample so you can see what it's like, also our illustrated catalog

Mail your request *today* to our nearest branch.

THE CANADIAN H. W. JOHNS-MANVILLE CO., LIMITED

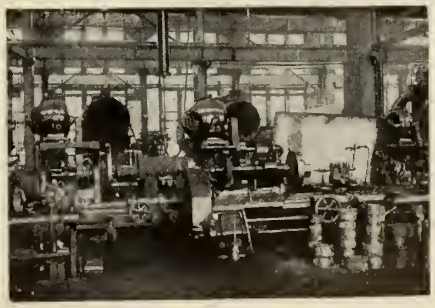
TORONTO MONTREAL WINNIPEG VANCOUVER

1595

Maximum production can be obtained only with a drive that transmits maximum power to your machines.

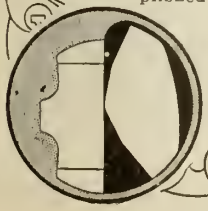
Morse Chain Drives

have a sustained efficiency of fully 99 per cent., due largely to the exclusive frictionless "Rocker-Joint."



First used in the small bicycle chain, the rocker-joint has been improved and developed into the most successful power chain joint construction known.

Twenty years' satisfactory use stamps the theory of design mechanically correct—close to perfection.



From 6 to 10 years' operation of numerous drives without repairs compares favorably with the average life of belting and gearing under many conditions.

In all other characteristics, MORSE chains are much superior to either belting or gearing, such as efficiency, maintenance and attendance costs, ease of installation, protection of electric motors, silent operation, etc.

Let us tell you what MORSE Chain drives have accomplished for others in your line of business.

42" Niles, and 25" and 20" Putnam Lathes driven by the same Morse Silent Chains installed in 1903.

GEARS

Cut This Out
More coming each month.

Gear Data for Your Note-Book

Strength of Gear TEETH

From the Hamilton Gear & Machine Co., Toronto

1. From speed and diameter get pitch line velocity in feet per minute = p.l.v.
2. Horse power × 33,000 = P, power in foot pounds per minute.
3. Divide P by p.l.v., giving W, the working load on teeth in pounds.
4. Knowing the kind of material and the p.l.v. (1) get S, the allowable working stress in pounds per square inch from curves in diagram published in our last month's advertisement.
5. Divide W by S, giving R, a strength factor for the conditions of the load.
6. We have already assumed the diameter. Now take any pitch of teeth as a trial and find number of teeth.
7. From the table which we will publish in next month's advertisement, find the value of K for a gear of the assumed pitch and number of teeth and of a face equal three times the circular pitch. This K is the strength factor for the assumed gear.
8. From face = 3 × C.P. for strength factor R (7) find the face needed for strength factor R (5).
9. If this gives a badly proportioned gear with too wide or too narrow a face, try some other pitch or a different diameter.

See last month's advertisement for diagram and next month's for table to use in connection with the above.

CURTIS Air Hoists

Write for Catalog
No. 61

Are Ideal for Crane, Elevator or Overhead Trolley Service

NOTE the examples of adaptability shown in the cuts. These regulatable air cylinders are virtually straight-line motors, capable of the widest application to shop and industrial requirements.

If you have requirements for straight-line power motion, whether push, pull, or both; for hoisting or other purposes; no matter how steady or accurately the movement required, or whether the load is constant or variable, a Curtis air cylinder will safely and efficiently handle it.

We are prepared to furnish these cylinders, single or double-acting, straight air or air balanced; for vertical or horizontal service, with or without speed controllers, or pneumatic cushions, as their intended use may warrant.

For general hoisting they are superior to, and cost less to install, operate and maintain, than steam or electric. They are not affected by heat, cold, dust, dirt or dampness. You can

Tell us what you wish to handle and our engineers, without charge, will gladly tell you how to handle it to best advantage.

His Faith Was Well Founded

2256 E. 85th St., Cleveland, O., May 11, 1912.

Gentlemen:—Two years ago I had occasion to babbitt several bearings upon machines which ran upon reverse motion, carrying a heavy load. It is now two years since it was done, and at last accounts bearings still in A1 condition. When I insisted upon wanting MAGNOLIA METAL, was asked why I was so particular. I simply said time will tell. I had used it before and say to any Engineer who may have a troublesome bearing—"try MAGNOLIA METAL, and your troubles cease." To prove its worth I bought it myself, and found the proof was in the using.

Yours truly,

GEO. STANFIELD, Secy.,
No. 5, N.A.S.E.

A. J. WORTMAN
Steam, Gas, Hydraulic and Pneumatic Engineering

Bellaire, O., Dec. 20th, 1910.

Gentlemen:—My experience with MAGNOLIA METAL, though brief, becomes interesting in demonstrating the peculiar fitness of this particular kind of metal.

The crank pin on one of a pair of twin engines driving a two-stage centrifugal pump persisted in running hot, and we tried plain brass and two kinds of babbitt without success. A liner of MAGNOLIA METAL was run in—that was about three years ago, and it is still running about 15 hours per day, giving no trouble whatever. It ran cool right from the start.

Yours very truly,

A. J. WORTMAN, Chief Engineer,
Benwood Water Co.,
Benwood, W. Va.

Canadian Machinery

C ONTAINS a complete record of development in the machinery and metal working industries of Canada.

A DVISES in the matter of reducing costs and improving quality of product.

N EITHER prints puffs nor suppresses any legitimate news pertaining to the field it serves.

A NSWERS knotty problems that may puzzle even trained mechanics.

D ESCRIBES the construction, layout and equipment of modern manufacturing plants.

I NCREASES the efficiency of its readers and makes possible better work and more pay.

A LWAYS up to the minute with its news and editorial articles. Its industrial news section is full of meat for the business or sales manager.

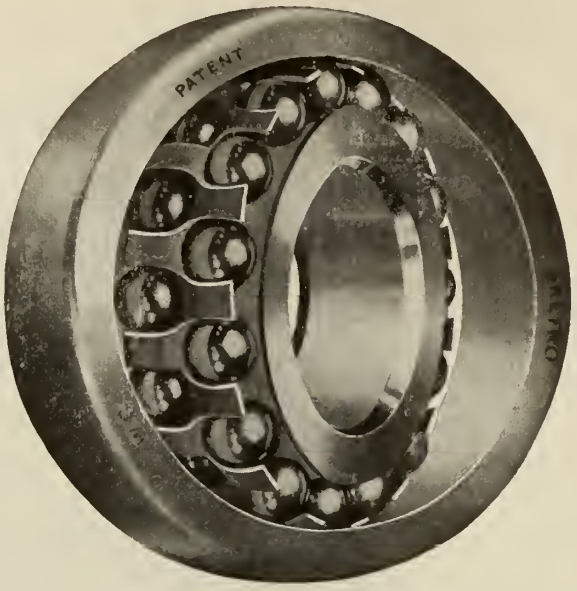
N EW machines and equipment are carefully described and illustrated.

M AKES the best possible medium between the maker of machinery and the user.

A CCOMPLISHES more in the way of educative and preliminary sales work than any other single force you might employ.

C ONVINCES a prospect of the merit of your goods long before *your* salesman or a *competitor's* salesman calls.

H ELPS your personal saleswork, circularizing, catalogs and letter writing.



I NFLUENCES business to-day that may not, perhaps cannot, materialize for months, perhaps years. That's why the continuous advertiser is successful.

N O unreliable manufacturer is represented in its pages. Because of this our readers turn to "Canadian Machinery" for information, suggestion and help.

E STABLISHES a connection that is not dependent on anything else for its strength and lasting powers.

R ENEWS interest in your line each week, and gives the jack-screw of your prestige another turn to the right.

Y OU ought to advertise in "Canadian Machinery" if you have a line good enough to merit our readers' attention. To be classified in our Buyers' Directory is to be on an exceedingly profitable patronage list of wealthy, prosperous and discriminating buyers. This is a fine time to say: "I will—here goes."

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

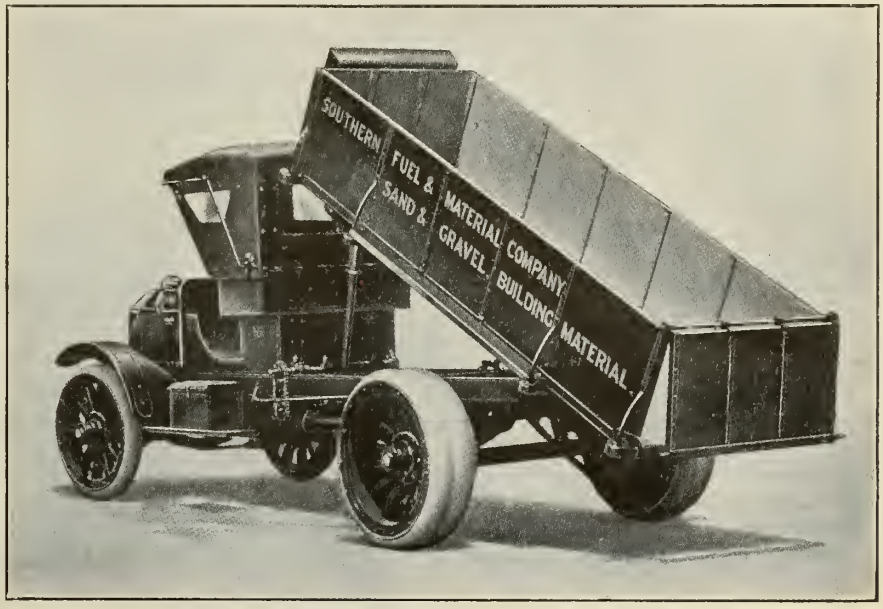
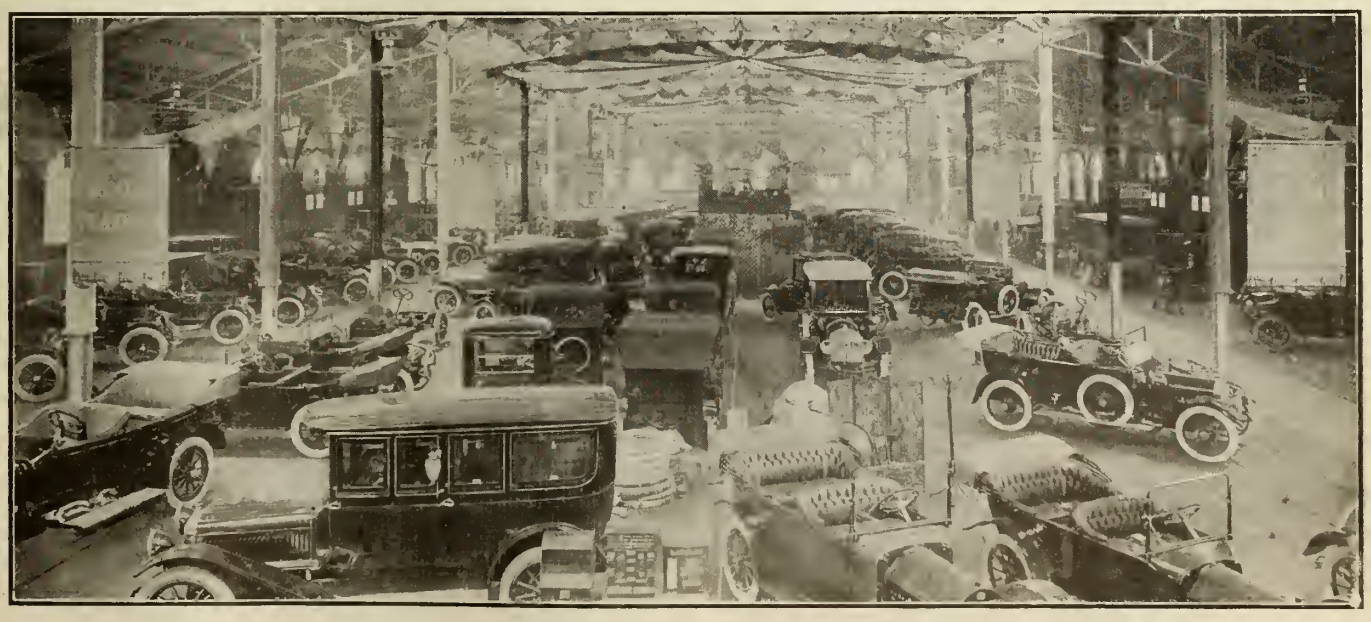
The Motor Truck Feature at the Toronto Automobile Show

Staff Article



There was no mistaking the increasing popularity of both the automobile for pleasure and the motor truck for business by even the casual visitor at the recent motor vehicle show held in a section of the C.N.E. Buildings, Toronto, and the unqualified success of this annual enterprise will not fail to become easily evident on our already busy and somewhat congested city streets. Both for pleasure and commercial cars many new enthusiasts have been added to the list of owners.

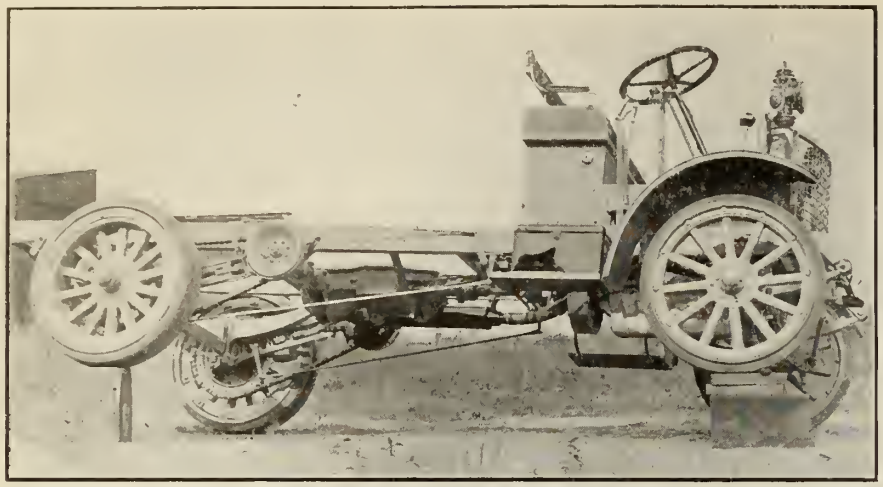
THE annual Toronto Automobile Show was held at the Exhibition Grounds, February 14 to 21 inclusive. One of the distinctive features was the increased number of motor trucks exhibited; these included heavy and light models and delivery trucks. This feature, no doubt, reflects the growing interest being displayed by manufacturers, express companies and others in the problem of transportation by means of motor trucks. The facility with which modern trucks can be operated, the increased loads that it is possible to carry, and also the improvement in design and construction which is apparent each year, are all responsible for the increasing popularity of this type of vehicle.



Pleasure Car Feature.

Pleasure cars, of course, comprised the largest number of exhibits, most of the leading makers being represented. It cannot be said that there were many startling improvements in design, pleasure cars having now almost reached that state of perfection where radical changes in design seem to be almost impossible. Self-starting apparatus seems to offer the greatest field for improvement.

Among the pleasure car exhibits were to be seen that of the Russell Car Co., Toronto, whose exhibit included a chassis in operation, a number of standard models and a motor ambulance recently donated to the Toronto General Hospital by Mr. T. C. Eaton. The "Cadillac" cars were exhibited by Hyslop Bros., Toronto, while the Automobile Supply Co., Toronto, were showing the Pierce Arrow, Paige-Detroit, Chalmers and Hupmobile, the latter car being equipped with a Westinghouse self-starter. The Ford Motor Co., Walkerville, had one of each type which they make, and were also exhibiting a production chart showing the output each hour of the current day, for both the Canadian and American factories. The Ontario Motor Car Co., Toronto, were showing a number of Packard pleasure cars in addition to the truck. The Republic Motor Co., Toronto, were exhibiting Oakland and Republic cars, while the York Motors, Ltd., Toronto, had several Studebaker and Cole cars. The White Co., Toronto, exhibited a number of cars and trucks, and the Do-

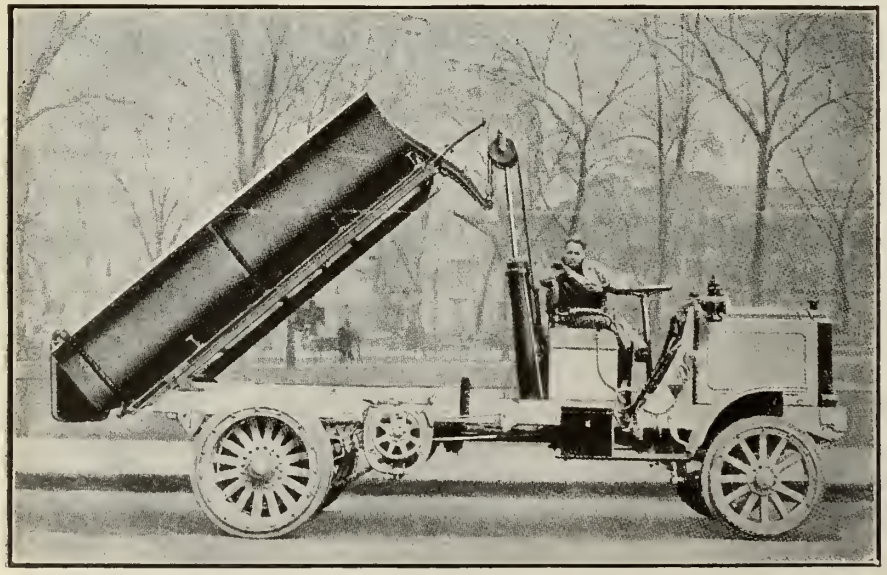


5-TON "PEERLESS" MOTOR TRUCK.

GENERAL VIEW—TORONTO AUTOMOBILE SHOW.

minion Automobile Co. were showing Peerless cars and a truck, also Hudson and Stephens-Duryea pleasure cars. The

2-TON "GRAMM" MOTOR TRUCK CHASSIS.



Wolseley Tool and Motor Car Co., Toronto, were exhibiting several fine models, also a chassis. The Reo Motor Car Co., St. Catharines, Ont., exhibited both trucks and pleasure cars. Electric pleasure cars were exhibited by the Tate Electrics, Ltd., Walkerville; Detroit Electrics Co., Detroit, and by Death & Watson, Toronto. The "Overland" car was to be seen, as were also pleasure cars and delivery trucks exhibited by the McLaughlin-Buick, Oshawa, Ont. There was the usual display of tires and accessories, while oil supply systems were exhibited by the S. F. Bowser Co., Toronto.

Motor Trucks.

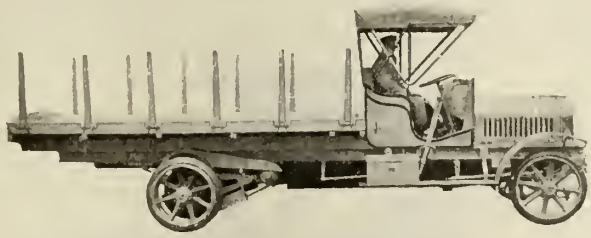
The motor truck exhibits included trucks of various capacities up to 5 and 7 tons, the 5-ton models being represented by the "Commer" car, Albion, Packard, Peerless and White trucks. A comparatively new feature to be seen in connection with the majority of the heavy service cars was a speed control device, generally consisting of a centrifugal governor attached to the crank shaft and operating on a valve in the fuel supply pipe to the cylinders. This apparatus shuts off the supply of oil when a certain speed has been attained, usually from 10 to 12 miles per hour. The arrangement protects the truck from traveling at excessive speeds, and from probable injury, especially when loaded. Chain drives seem to have been generally adopted for heavy trucks, and worm drive for some of the lighter models. With the exception of one electric vehicle, all the trucks were equipped with gasoline motors.

2-TON "REO" MOTOR TRUCK.

5-TON "PACKARD" MOTOR TRUCK.

Albion Trucks.

The Albion Motor Car Co. of Canada, Ltd., Montreal, exhibited a 5-ton truck having one or two interesting features. One of these is a centrifugal governor on the crank shaft, which shuts off the supply of gasoline when a speed of twelve miles per hour has been reached. The device operates independently of the drivers, and only comes into operation at the maximum speed. Another feature is the disc clutch, which consists of two asbestos rings connected to the motor shaft and a steel disc between them connected to the drive shaft. The co-efficient of friction being a fixed value, the clutch when engaged will only transmit a given power, thus protecting the gears. The carburettor is situated inside the water jacket, and is always kept at an even temperature, thereby enabling the same results being obtained at all times. Trucks up to 2½ tons have worm drive, and those from 3½ to 5 tons are equipped with chain drive.



Packard Truck.

An interesting exhibit was the Packard 5-ton truck, equipped with a dump body. The dumping mechanism consists of a cylinder filled with oil, which is forced from one end by a centrifugal pump driven from the motor shaft. When lifting the front of the body the oil is forced to the bottom section of the cylinder from the top section, and when lowering the action is reversed. The truck is equipped with a 4-cylinder slow-speed motor and chain drive, and with a centrifugal governor for controlling the

speed when a maximum of ten miles has been reached. There were also on show a number of delivery trucks.

Thornycroft Truck.

Two Thornycroft trucks were exhibited by the Maritime Motor Co., St. John, N.B., who were also showing a "Maritime Singer" pleasure car chassis. The largest truck has a capacity of 3 tons and is equipped with a 4-cylinder motor with cylinders 4½x5 stroke. The wheels are of cast steel fitted with solid rubber tires and have chain drive. One special feature of this truck is the tilting front axle which is so constructed that when the truck is traveling over uneven ground, the frame is not subjected to any twisting strains. Adjustable windshields are fitted and the cab is exceptionally roomy. The 2½-ton truck chassis is equipped with worm drive, cast steel wheels and solid rubber tires. Both models are furnished with speed control governors. It will be interesting to note that the Thornycroft trucks have gained awards in a number of reliability trials under the supervision of the British war office.

2½-TON ALBION MOTOR TRUCK.

Peerless Truck.

The Peerless Motor Car Co., Cleveland, O., were exhibiting a 5-ton power dumping truck operated by a double screw power hoist. The hoist operates on the telescoping screw principle, one screw working inside the other and each in turn taking half the travel of the body. This arrangement reduces the amount of head room which would otherwise be required if only a single screw were used. The screws are operated from a secondary shaft in the gear box. The truck is fitted with a 3-point suspension, 4-cylinder motor, and a speed control governor.

"Commer" Car.

Four trucks made by the Commercial Cars, Ltd., Luton, Eng., were exhibited by the Industrial Motor Trucks, Ltd., Toronto. The exhibit consisted of one 7-ton, two 5-ton and one 1½-ton trucks. The two former models are built for heavy service and are equipped with enclosed chain drive, while the lighter model has worm drive. One of the outstanding features of the heavy trucks is the speed gear mechanism. The gears in the gear box are always engaged and, therefore it is impossible to strip the teeth. The drive is effected through sliding dog-clutches which are moved by fly-to-centre levers operated by a lever in the steering pillar. On the drive shaft forward of the gear box is a clutch fitted with rubber pads for taking up the shock. This clutch comes into operation first. The two 5-ton trucks have been sold to the Motor Transport Co., Hamilton, Ont.

3-TON THORNYCROFT MOTOR TRUCK.

Gramm Truck.

The Gramm Motor Truck Co., Walkerville, Ont., exhibited a 2-ton chassis which was sufficient to demonstrate the principal features embodied in the design of this company's product. The transmission and bearings are all of the Timken make and all wearing surfaces are well lubricated. The gears and differential are together in one gear box, making a very compact arrangement. A centrifugal governor is fitted to the motor to control the speed when reaching the maximum, and the radiator is protected by a guard. The weight distribution is one of the principal features of this truck.

"Reo" Truck.

A 2-ton truck was exhibited by the Reo Motor Truck Co., Lansing, Mich. One of the principal features to be noticed was the construction of the radiator, which is built in units, thereby enabling any single unit to be removed, in case of leakage, without the truck being taken out of service. This truck is fitted with a speed control hydraulic governor operated by pressure of water in the cylinder water jacket system, the water being circulated by a pump on the motor shaft. The pressure of water operates on a diaphragm valve fitted in the full supply pipe.

3-TON WHITE MOTOR TRUCK.

McLaughlin-Buick Truck.

The McLaughlin-Buick Co., Oshawa, Ont., were exhibiting, in addition to the pleasure cars, two 1,500-pounds delivery trucks and a chassis of the same model. These trucks are equipped with centre shaft drive, artillery wheels and pneumatic tires.

Ward Electric.

The Ward Motor Vehicle Co., New York, had an electric delivery truck and one chassis. The former has a capacity of 2,500 pounds and is equipped with a Westinghouse motor, Ward or Edison

batteries. The chassis has a capacity of 2½ tons and is furnished with the same equipment.

Brantford Truck.

Two models of delivery trucks were exhibited by the Brantford Motor Truck Co., Ltd., Brantford, Ont. The capacities range from 1,000 to 1,500 pounds and both models are equipped with planetary type transmission, four cylinder motors, artillery wheels and rubber tires.

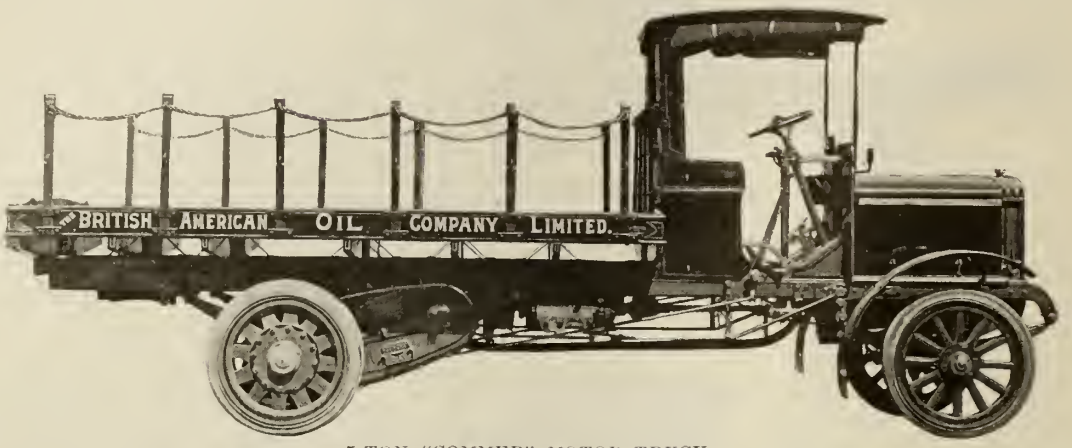
CHILLED IRON CAR WHEELS.

GEORGE W. LYNDON, in a paper prepared for the Association of Manufacturers of Chilled Car Wheels, estimates, says the Iron Age, that there are 20,000,000 chilled iron wheels in service. In the last three years more than 300,000 special chilled iron wheels have gone into freight service, the majority of them on cars of 50 tons or greater capacity, many of which are operating in localities where severe conditions are imposed. One test is mentioned of a large railroad which in 1907 equipped 50-ton coal cars to the number of 500 with special chilled wheels. The cars operate, as a rule, in mountainous country and are constantly in service. It is found that at the close of the sixth year more than 80 per cent. of the wheels are still in service, and it is predicted that the average life will prove to be eight to ten years.

Mr. Lyndon considers that chilled wheels have the following advantages over other types of wheels:

Greater economy in first cost and shop expense.

Less loss of metal in tread and flange per ton mile of service.



Greater ability to carry heavy loads, as the tread metal does not flow under pressure.

Twenty to 25 per cent. greater braking efficiency.

Twenty to 40 per cent. less consumption of brake shoes.

Less abrasion of steel rails.

Less power consumption.

5-TON "COMMER" MOTOR TRUCK.

ALLOY STEEL IN LOCOMOTIVES.

THE use of alloy steel, properly heat treated, for locomotive parts, has been attended with much success. In addition to those parts where the steel is used for its effect in giving greater reliability or improved wearing quality, such as frames, springs, axles, and tires, it is also used for other parts where, indirectly, it permits of a large increase in the capacity of passenger locomotives. This result, states the Railway Gazette, arises from the fact that the permissible weight that can be placed upon the coupled wheels depends very largely on the weight of the excess counterbalance that is included to balance the reciprocating parts, and therefore by lightening these parts and reducing the excess it is possible to use an increased static weight on the driving wheels. This, in turn, means that the boiler can be very materially enlarged, and thus the capacity of the locomotive as a whole increased.

Alloy steel, properly heat treated, when combined with careful designing, will accomplish much in reducing the weight of the reciprocating parts, and the net result of the reduction with one type of locomotive was that a deadweight considerably in advance of that previously possible could be placed on each axle with entire safety. At 70 miles per hour, with this locomotive, the dynamic augment of the excess counterbalance is less than 30 per cent. of the deadweight on the driving wheels, and even then the locomotive will not impose as great a stress on the track nor do as much damage to itself as is experienced with most engines which have a considerably less weight on each driving axle.

THE WEATHERING OF COAL.

MUCH has been written on the weathering of coal, says a writer in the Power User, and generally speaking it has not borne out the complaints that are made as to the capacity of weathered coal for steam raising. There are several actions at work when coal is weathered.

First, there is the actual contact of the atmosphere. When coal becomes hot in a pile it is because it is being slowly oxydized, and there is not sufficient cooling at work to keep down the temperature. Now, if coal can oxydize in this manner it is being destroyed as coal. Probably in a closely-packed heap a very small amount of heat will produce a considerable temperature, for the heat is locked in, and all accumulates until a high temperature is attained. Then, if air be admitted, the heap may fire. Some deterioration must have occurred, for a coal cannot be twice oxydized, and once it has been hot some of its calorific value has passed off. It is said also that once coal has become hot in the heap and has cooled down, it will not again become hot. It would thus appear that there may be some principle in coal which is specially ready to oxydize, that its amount is small, and that once having heated there is none left to repeat the process.

In recent years it has been observed that coal dredged up from salt water, where it has lain many years, is quite uninjured. It has been kept cold, away from contact with air, and has not been knocked about, and, we believe, steps have been taken to provide under-water storage for coal at the coaling stations of the Navy. A further advantage is that such coal ceases to be a grimy nuisance as soon as it is submerged, and also that it is effectively fenced against all possibility of fire. Various reports and papers have appeared in different publications on the weathering, heating and storing of coal but, at the moment the writer cannot locate these. Coal is probably a very complex substance, but very little is known of its actual constitution. It can be analyzed for its ultimate elementary constituents—so much carbon, hydrogen, sulphur, oxygen, nitrogen, so much silica and alumina, and small quantities of iron and other elements. If distilled at a high temperature, it will give off a certain number of products, compounds of the foregoing elements. If distilled at a low temperature, a different set of compounds are given off, but it cannot be said even that these are present in the coal. Rather they are present out of the coal.

Development of Chain Gearing for Power Transmission--III*

By H. T. Hulage

Chain gearing as a possible solution of the problem of furnishing an improved means of transmitting power to machines in factories and workshops is dealt with in the accompanying article, while a resume is also given of the progress made in design, manufacture and application as exemplified in modern installations.

THE third and concluding portion of this comprehensive article on chain gearing as a power transmission medium is here given, and deals more particularly with the considerations to be accounted in determining installation advisibility for specific conditons.

Widths of Chains and Wheels.

One of the conditions—namely, bearing area required—that influences the decision as to the width of the chain has already been spoken of. The others are the fact that there must be sufficient surface in contact between the wheel and the chain to avoid excessive wear in the wheels, and the fact that the stud must be sufficiently stiff to resist any tendency to bending, in case, from any accident or other, the contact between the chain and the wheel should become a point contact instead of a line contact.

Number of Teeth in Wheels.

It is obviously possible to make roller-chain pinions with as few teeth as may be desired, and, as a matter of fact, if the speeds are very slow indeed, and duty light, it is possible to use as few as 6 teeth. With ordinary speeds, however, the impact on small pinions becomes very great, and in general it is not desirable to use less than 12 teeth. On the other hand, it is evident, from a consideration of tooth-form design, that the adjustment for pitch extension is not so great on the bush roller as on the silent chain, and therefore it is not so desirable to use so many teeth in the large wheel. For good practice it is well to consider 80 teeth as the maximum number to be used in ordinary cases.

Application.

From the nature of the problem, and in the absence of standardization of design, it is difficult, if not impossible, to give anything more than general indications on the application of chain-gearing. In broad terms, the problem may be stated as follows:—Power is to be transmitted from one shaft to another. The amount of power is fixed, the distance between the shafts may, or may not be fixed, the speed of turning is fixed, the drive must fulfil certain definite conditions with regard to cost, uniformity of turning, noise or vibration, and space available. The questions to be answered, then, with regard to chain-gearing are:

1.—Is it adaptable for this particular case?

2.—Which type of chain is best?

3.—What will it cost?

4.—How much space will it occupy?

5.—How long will it last?

1.—There are very few considerations that absolutely rule out the practicability of using chain-gearing, and it is rather difficult to state exactly what they are. If the horizontal distance between the shafts exceeds 20 ft., chain-gearing is out of the question, unless intermediate staffs can be used.

If the direct centre distance be very great, and no adjustment for the chain can be provided, then, again, chain-gearing is not available. If it be essential that the transmission should run absolutely without attention, either automatic or otherwise, as regards lubrication, adjustment, and cleaning, then some other transmission had better be used. Other answers to this question would probably be found in answering the other questions—i.e., in certain cases chain-gearing would be ruled out on account of its excessive cost. It might be ruled out on account of the space that it would occupy, or in some cases by the shortness of its life.

2.—The following general tables will show the limitations of silent and bush roller-chain gearing as regards speeds and powers:—

Table I.—Silent Chains.

Pitch.	Range of Speeds (R.P.M.) for Constant H.P.	Maximum H.P. One Chain.
0.5	990 to 1835	4.5
0.625	790 " 1470	7.5
0.75	660 " 1225	14.5
1.0	495 " 920	32.0
1.25	440 " 735	53.0
1.5	405 " 610	75.0
1.75	375 " 485	145.0
2.25	220 " 375	270.0
3.00	165 " 270	400.0

This table is calculated on the assumption of a 17 T pinion, a maximum linear chain speed of about 1300 ft. per minute for the small pitches, and 1200 ft. for the larger pitches, and a maximum bearing pressure at these maximum speeds of about 650 lbs. per sq. in.

Table II.—Bush Roller-Chain.

Pitch.	Maximum R.P.M.	Maximum H.P.
0.5	2005	1.5
0.625	1540	1.5
0.75	1205	2.0
0.875	995	2.5
1.0	812	3.0
1.125	680	3.5
1.25	583	5.0
1.375	500	7.5
1.5	431	9.0
1.75	332	14.0
2.0	258	20.0
2.25	205	27.0
2.5	163	34.0
2.75	131	40.0
3.0	105	50.0

This table is calculated on the assumption that the minimum pinion will have 13 T, and the maximum speed is what has been shown, by long experience, to be perfectly safe.

Beyond this, the silent chain can only be used where the shafts are rotating in the same direction, but bush roller-chain can be used for a reverse drive by the intervention of a third shaft. Where noise and vibration must be reduced to a minimum the silent chain should be used; and, in general, if it be desired to reduce the noise and vibration, a shorter pitch chain, whether of the silent or roller type, will be preferred to a longer. Evenness of turning is affected by the pitch of the chain and the number of teeth in the wheels.

As has already been stated, chain-wheels are not perfect circles, but polygons, and, obviously, if the polygons have few teeth, the uniformity of turning may be sensibly affected. An example of this kind has been found in driving grinding machinery, where an emery-wheel running at a very high speed is grinding a spindle running at a comparatively low speed. If the spindle be turned by a chain-wheel having very few teeth, it is obvious that its angular velocity may vary sufficiently in a single revolution to permit the quick-running emery-wheel to leave definite marks upon it. Cases in which uniformity of turning, due to this fact, influence the drive, however, are comparatively rare.

The bush roller-chain, whilst being inferior from the point of view of mechanical refinement, and whilst not filling so well as the silent chain the general requirements of a good transmission, is of more robust design than the silent chain, will stand much more rough usage and neglect, and because of the shape of its links, can be used with smaller factors of safety, as regards strength, than the silent chain. Broadly speaking, therefore, it will be selected, by preference, where either type of chain is available, where durability and long service are more important than mechanical refinement, and where the avoidance of noise is not the most important consideration.

3.—The question of cost may involve the selection of several suitable chains, and several suitable sizes of wheels, and the making of a comparison between their prices, and no indications can be given which will be of any value in a general consideration of the problem.

4.—The question as to the space that will be occupied can be answered with accuracy when the chains and wheels have been selected. Generally speaking,

*From a paper read recently before the Manchester Association of Engineers.

a chain-drive will occupy considerably less space, both as regards width and centre distance, than belt or rope-drives, and it will occupy more space, both as regards width and centre distance, than spur gearing. It can, under certain conditions, however, be compressed into the same space, as regards centre distance, and, in a smaller number of cases, as regards width also, occupied by spur gearing.

5.—It is in seeking an answer to the question "How long will it last?" that the main problem of selecting and valuing a chain-drive must be attacked, and it involves a careful study of all the elements of the drive and all the features of the chain and wheels. A good deal of progress has been made in the application of chain gearing, and experience and information, both of a general and special character, have been obtained; but the cases in which chain-gearing have been successfully applied have varied so greatly as regards conditions that affect the rate of wear, many of which are not capable of numerical expressions, that it has not been possible to collect and tabulate the kind of information that would enable one to say when designing a new drive, how long it would last. In order to obtain a general solution of the problem, all the features have to be considered. For example, not only must the speed of the chain, the pull on the chain, or the power to be transmitted, and the angle turned by the links on the pins, length of the chain, or, what is the same thing, the distance between the shafts, the size of the wheels, the area of the bearings of the chain, and the degree and depth of hardness of the parts be considered; but the lie of the drive, the accuracy of erection, character of lubrication, the nature of the load, and other considerations may have a great if not determining, effect on the life of the chain.

What precise effect in increasing or diminishing the life, a specified change in any one of the conditions mentioned will bring about, must be determined. The degree and depth of hardness of the chain parts can, of course, always be regarded as constant. If each of the other conditions in turn remains constant, the life of the chain will be approximately inversely proportional to the chain speed, to the pull on the chain and to the angle turned by the links or by the pins in unit time; this, of course, as long as the conditions do not preclude efficient lubrication. Under the same circumstances, and within certain limits, the life will be almost directly proportional to the distance between the shafts, and to the area of the bearings of the chain. To some extent these more or less exact relationships will be varied by the effect of impact and by variation in the quality of the lubrication but it will be seen from what has been said that before any definite rules can be laid down some careful research is necessary, a large number of experiments must be made, a large number of chain-drives must be watched over extended periods; the information obtained must be carefully analyzed, due consideration being given to the other features of a chain drive which cannot be so readily expressed numerically; namely, atmospheric and temperature effects, variations in the character of lubrication, impulses in the drive, the lie or inclination in the line joining the centres of the shafts, and so on.

FAILURES OF CONCRETE STRUCTURES.

IN a recent article, says the engineering correspondent of the Daily Telegraph, London, the decay of concrete through moisture has been discussed, together with means for rendering the material waterproof. The chemical reactions causing this decay were briefly enumerated, being well understood by concrete engineers; but it has often been found that concrete structures show local patches where the surface has become quite soft, being reduced to what the chief inspector of one New York Railway euphemistically describes as "mush." Yet these parts, in common with the remaining undamaged portions, were made from the best materials, which had undergone rigid tests.

A number of bridges and tunnels on the Rapid Transit Railway, New York, were recently found to have begun to fail in spots in this way. They were all above tide level, so that the action could not be ascribed to salt water alone. It then occurred to those in charge to apply a voltmeter test to the concrete. The wet disintegrating spots proved in all cases to be carrying electric currents under pressures of from 1 to 5 volts. Dry parts showed no voltage at all, and were in excellent condition, though laid at the same time and of the same mixtures. Moreover, it seemed to have made no difference whether the concrete was laid in summer or winter, the only difference being that the failing regions had accidentally become wet.

It is well-known that wet concrete becomes a conductor of electricity, and it seems that stray electric currents from power plants, railways, etc., find their way to wet spots, and in their passage destroy the cohesion of the concrete. This process is known as electrolysis, and the simplest way to illustrate this is to pass a current between two metal plates, known as electrodes, dipped in acidulated water. The current splits the water into its constituent gases, the oxygen collects at the "anode," where the current enters, and the hydrogen is carried on to the "cathode," where the current leaves the liquid. Solutions of salts such as sodium and calcium-chlorides and the aluminium and silicon compounds found in concrete are particularly susceptible to this process of electrolysis. For any serious occurrence of electrolysis it is necessary to have the equivalents of the anode and cathode, that is, to have metal in actual contact with the concrete, also the concrete must be damp.

Electrolysis.

From this it follows that we must look for electrolysis in reinforced concrete. In such structures there are a number of steel rods in close contact with the concrete. It has often been noticed that the steel reinforcements in parts become surrounded after a time by cores of soft, discolored concrete, which is quite wet.

With the object of investigating this phenomenon and checking it, an exhaustive series of tests has been made recently at the United States Bureau of Standards, Washington. Cylindrical specimens of concrete are arranged with a metal rod as electrode embedded in each. These test specimens are placed in water in a metal jar, so that the jar and the rod can be connected up to a source of electric power, and a current may be made to flow either way by arranging the connections suitably. It is found that a pressure of 50-70 volts, causing a current to flow from the embedded iron to the concrete, splits the latter open in about twenty-three hours. The action is attributed to the swelling action of the big deposit of rust which appears on the iron, and is due to the action of the current.

The idea largely held that the concrete itself becomes deteriorated is disproved; it is merely shattered by the mechanical strength of the growing rust deposit, and the broken portions are as strong as before the test. These experiments at 70 volts are more of scientific than of practical interest, as such a heavy leakage is very unlikely to occur in a building or other structure.

Low Voltage Current Flowing From Iron to Concrete.

A very large number of specimens were tested with the embedded iron as positive electrode and voltages of 15 or less. In this case it is found that after the lapse of many months' continuous test there are no signs of splitting. The concrete on being broken open is found to be quite good and undamaged, whilst the iron is quite bright, except at the top and for about an inch below the surface. Thus, it is evident that the damage to be expected diminishes to a very small amount when the voltage is reduced to

such as one would expect to meet in practice. These remarks apply only to the case of current flowing from the iron to the concrete; when the direction of the flow is reversed, the electrolytic action tends not to corrode the iron, but rather to keep it bright. Consequently it has often been asserted that no damage will be caused by electric currents flowing from the concrete to the iron.

From Concrete to Iron.

that it can be shaved like wet pumice with a penknife. It is also discolored. During the tests it was observed that hydrogen was being evolved at the electrode, which forced its way to the top, bringing with it calcium-hydroxide in solution from the cement. This hydroxide, in contact with the air, formed calcium carbonate, otherwise chalk, on the top. The disintegration had the effect of reducing the "bond," or holding power between steel and concrete, by amounts varying up to 4-5. This is a serious matter in reinforced concrete structures.

A notable point is that this cathode effect does not diminish to a negligible amount at voltages below 10, as does the previously described anode effect.

In all the tests it was noticed that the resistance of the concrete to the flow of electric current rose more or less rapidly as the test proceeded. This rise was very marked when the current flowed from the steel to the concrete, the resistance after six months being on an average 137 times its original value. This phenomenon is one of great importance, as it shows that the concrete tends, so to speak, to arm itself against damage by automatically minimizing the cause. The explanation is that calcium carbonate is formed, as mentioned above, at the anode, and forms a film of very high resistance. With the cathode specimens, the resistance seems to be due to a film of gas round the metal. The rise is not so marked, and disappears when the gas has passed off.

Mixing Salt With Concrete.

It is the practice of some engineers when laying concrete in cold weather to add common salt or calcium chloride, either of which lowers the freezing point of the mixture thus minimizing damage due to premature setting. The Bureau of Standards strongly disadvise this practice. The salts have no detrimental effect on the concrete itself, but when a current is passed, the acid radical, chlorine, in which they are both rich, prevents the deposition of calcium carbonate, whose plugging action in the pores causes the protective rise of resistance. Moreover, it is found that both compounds materially increase corrosion of the iron.

Sources of the Trouble in Practice.

A probable and possibly serious source of danger is faulty insulation of electric leads in a building. The short-circuiting of a cable on to the concrete will not usually have very serious effects, for the area of section to carry the current away will be very large, comprising pipes and other metal fittings. There will be some softening near the footings, where the current escapes to earth, but this part being in compression and not in shear, there will be little tendency to destroy the bond of the reinforcements. Serious results may arise, however, from a good electrical contact between the reinforcements and either the positive or negative side of the cable. In the former case the potential fall near the reinforcement may be so great as to cause serious corrosion. In the latter case the concrete may soften till the bond is practically destroyed. This is probably the more serious case of the two.

Currents From Outside.

It is found that a considerable amount of leakage occurs from the return rail of electric railways. These currents find their way into buildings which are adjacent by way of pipes, lead cable conduits, and so on. If the point of contact is on the concrete, the voltage drop is so widely distributed that the damage is local, and of very small amount; but if the pipes are in metallic contact with the reinforcement, as much as 5-15 volts difference has been detected between the latter and the earth. This causes damage which is slow but sure, owing to the steady supply of electric energy at the faulty point.

It must be borne in mind that the effects described are "electrode effects." They can only occur when the concrete is in metallic contact with sources of electric energy, and when it is damp. These conditions make the precautions to be taken self-obvious. All parts of the structure, particularly below ground level, must be made waterproof as far as possible. Much benefit may be derived from placing layers of cotton treated with pitch under the foundations and round the basement walls. This material has a high electric resistance as well as being a waterproofing medium. Even after the latter property has weakened with lapse of time the former remains of much advantage. Much good may be done by supporting the footings on granite, which, when wet, does not become a conductor to anything like the extent that concrete does.

Insulations.

Great cars should be taken to ensure that all electric wires are efficiently insulated, periodic tests being made for faults. It has been mentioned that pipes and cables entering the building are a serious source of trouble. This may be removed by inserting joints of insulating material, such as china, just before the point of entry. If a pipe or cable passes through the building, such insulating joints should be inserted at entry and exit, thus protecting the building.

PROBLEM OF THE THRUST BEARING.

HENRY T. NEWBIGIN in a recent paper read before the Institution of Civil Engineers, drew attention to the inefficiency of thrust bearings as compared with journal bearings and their disadvantages, especially in high-speed machinery. A comparison was made between Coulomb's laws of friction and the late Professor Osborne Reynolds's hydrodynamic theory of lubrication, and coefficients of friction in bearings of various forms were given, while the way in which the friction in a journal bearing changes from dry or greasy friction to perfect lubrication as the speed increases was also discussed. The late Beauchamp Tower's discovery of liquid pressure in the oil-film was described.

Viscosity was defined, and the resulting general formula compared with the results of Mr. Tower's and Professor Goodman's experiments. The conditions necessary for the maintenance of liquid pressure in an oil-film were also examined and defined.

The subsequent developments of Reynolds's hydrodynamic theory of lubrication were referred to, and A. G. M. Michell's formulae for the resistance of lubricated plane surfaces were cited: the paper concluding with description, illustrations and the results of tests of thrust bearings constructed on Michell's principle.

Vanadium in Brass.—A paper entitled "Vanadium in Brass" was read recently by Messrs. R. J. Dunn and O. F. Hodson before the Birmingham Section of the Institute of Metals. The work which the authors had carried out was designed to ascertain if small percentages of vanadium had any effect on the constitution and structure of copper-zinc alloys, and the conclusion was that, on the whole, annealing appeared to have rather less effect on vanadium brasses than on pure brasses. It was probable that the beneficial effect of vanadium was largely due to its deoxidizing power, but in that and in other respects it was difficult to estimate the exact effect of vanadium owing to the comparatively large amounts of aluminum and other metals present in many samples of commercial cupro-vanadium.

Development, Application and Testing of Pneumatic Tools-II*

By H. I. Brackenbury

Pneumatic appliances and apparatus adapted to one or more stages in the manufacture of mechanical and general industrial products determine by their installation in a plant, just to what extent the management of the latter are keeping pace with the progress and development being made in this particular sphere. Applied compressed air claims equal classification with electricity in the revolutionizing of manufacturing methods.

PART ONE of this article dealt more particularly with the historical side of pneumatic tool equipment. In the present instance the practical adaptation of this type mechanism is featured at considerable length; being therefore of rather more direct interest to those already taking advantage of the service rendered and to others prospective.

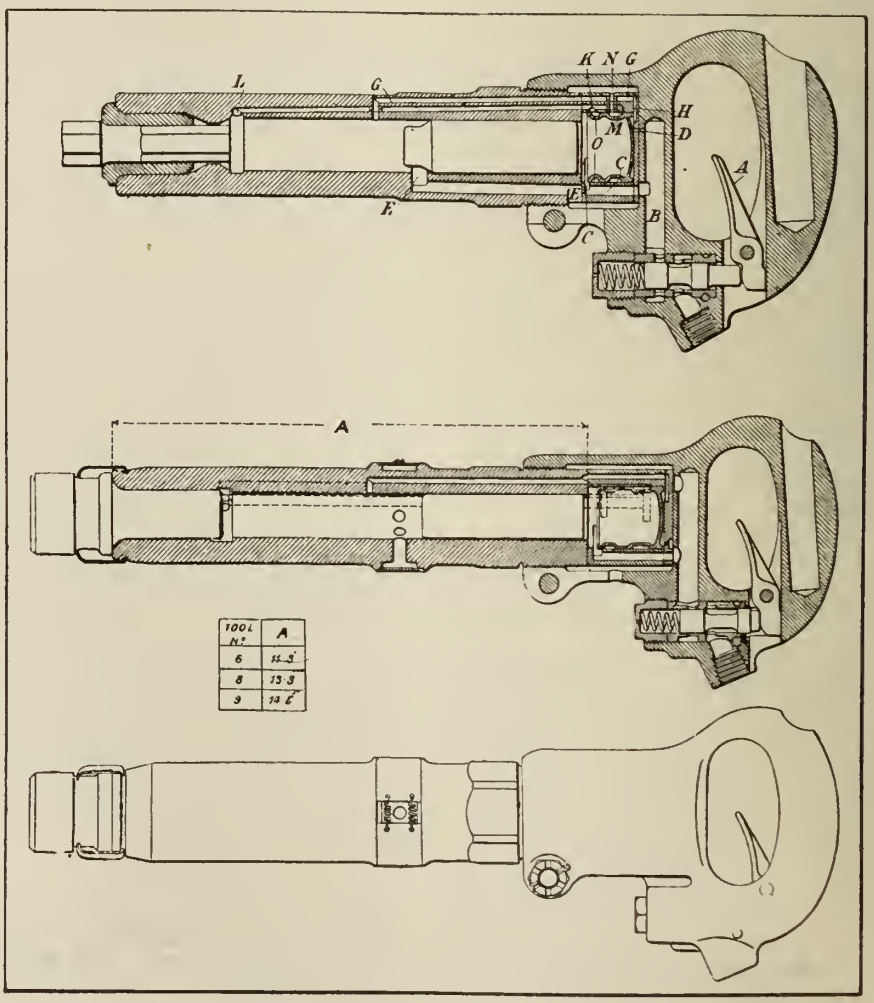
Tierney Chipping and Riveting Hammers.

Figs. 6 and 7 show the Tierney chipping and riveting hammers, and it will be noticed, although there are differences in sizes, the principle involved is the same for both classes of hammer. The design is of an exceptionally simple nature, the valve having but one working diameter, and being made in a form which give it strength combined with lightness. The piston enters into the valve, so that practically the maximum length of stroke for the length of hammer is obtained. The working of the hammer is as follows:—

Air is admitted to port (B) by pressure of the lever (A) and so to (C), and through the restricted passage (D) to the back of the valve. In the position shown, pressure acts between the piston and the front of the valve, while constant live air at the rear of the valve is open to exhaust through ports (H), (G) and (E). The piston thus travels down the cylinder, while air that would otherwise be trapped between the piston and the chisel passes through (L) to the groove (M) in the valve, and so to exhaust through (N). The piston having now uncovered (E) to the live air, pressure is released from it and the front of the valve, while the constant live air at the back of the valve being closed to exhaust by the piston, now drives the valve to its forward position. Live air now passes through (C) round the groove (O) in the valve to port (K), and so to the end of the cylinder, and the piston is driven up towards the valve. Upon uncovering port (E), pressure is released, and also the pressure on the back of the valve is released through (G), while the air trapped between the piston and the front of the valve forces it to its backward position.

*From a paper read recently before the Coventry Engineering Society.

Considerations Regulating the Design.



The problems presented to the manufacturer of pneumatic tools differ considerably from those involved in the production of other machines actuated by a fluid under pressure. The relative importance to be attached to the desirable qualities of reliability, efficiency, lightness, power and cheapness, which so often prove to be, to some extent, mutually antagonistic, is a matter to be decided only after long experience. Such experience, however, is useless unless it be accompanied by a clear understanding of how these qualities are interrelated. It is proposed, therefore, to undertake a slight investigation of the limitations under which the designer of pneumatic tools of necessity must labor, and then to consider the methods by which he may gauge the value of his product.

Before proceeding further, it may be well to say that the type of successful pneumatic tool is necessarily that which appeals to the purchaser, so that in the end it is his experience and wisdom to which we must look for the insistent demand for improvement in these tools. If the author can indicate some directions in which such improvements may be reasonably expected he will have succeeded in the purpose of this paper.

The desirable qualities in a pneumatic tool in their order of importance appear to be: Reliability, power, cheapness, lightness, ease of handling and compactness, and low air consumption.

The Air Consumption Feature.

Up to the present probably too little importance has been attached to the last of these desiderata. It is no uncommon thing to find a large and expensive air-compressor plant eating up power and

FIGS. 6 AND 7. TIERNEY PNEUMATIC CHIPPING AND RIVETING HAMMERS.

delivering enormous volumes of air to supply the incessant drain of leaking pipes and hose, and the intermittent demands of most wasteful types of tools. This fault is largely due to the infrequency with which the supply of air is measured. There are now on the market several types of instruments which will indicate the rate of flow of air with reasonable accuracy, although the price asked for them at present is rather high, owing, no doubt, to the small demand.

The author has used for some years a form of Venturi tube, connected to a U-tube manometer, and provided with a scale which corrects for pressure. A very similar instrument has since been placed on the market, and the general use of some such device should do much to initiate a demand for improvements in pneumatic tools. Perhaps it would be no exaggeration to say that quite generally the amount of air lost by leaking hose is almost equal to that used by the pneumatic tools themselves. The leak can be easily found by testing at meal hours, when the pneumatic tools employed will not be in operation, but the leak will be unaffected if the compressor plant be kept running. Without doubt the convenience and reliability of these tools fully justify their employment even under present conditions, but the following consideration may induce those that employ them to exercise greater vigilance in avoiding waste.

Avoidance of Air Waste.

Suppose that there are a number of leaks equivalent to a circular hole of about 1-10 in. in diameter—a case that would be only too easy to discover. If the air supply be 100 lb. per sq. in. pressure, the air leak will be about 15 cubic feet of free air per minute, or about 2 cubic feet per minute of the compressed air. The power required to compress this will be nearly 3 horse-power, so that the cost of the leak would waste about 120 cubic feet of compressed air per hour, costing about 32 cents per thousand cubic feet, or nearly as much as what is paid for coal-gas.

An inverted Welsbach burner consumes about 4 cubic feet of gas per hour, and gives at least 50 candle-power after having been used for some time. No manager would allow the wasteful burning of thirty such burners giving more than 1,500 candle-power, yet the equivalent leak of compressed air often passes unnoticed and unreproved. If a leak of compressed air were unpleasant or dangerous, it would be more likely to be rectified. As a matter of fact, this system of power distribution suffers from its very safety and innocuous character.

Pneumatic Drilling Machines.

The factors governing the design of pneumatic-drilling machines are entirely different from those for fixed machines.

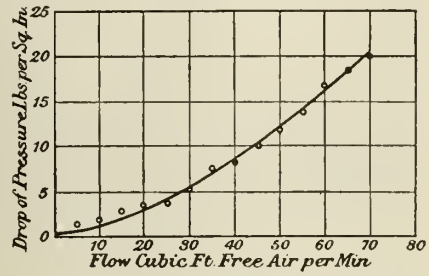


FIG. 9. DROP OF PRESSURE ALONG 16.5 FT. OF FLEXIBLE ARMOURED HOSE. ½ IN. DIA. BORE. INITIAL PRESSURE 85 LBS. PER SQ. IN.

In the latter case the machine is designed to run the drill at the speeds and feeds which will give the quickest penetration without undue wear to the drill. In the case of the pneumatic drill, the power is the governing factor, and, therefore, the design must be such as to use that power to the greatest advantage—i.e., to rotate the drill at the speed at which the greatest penetration is

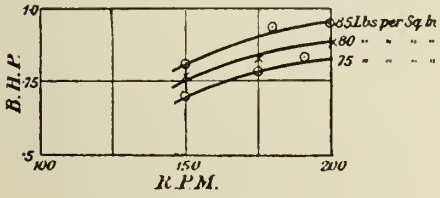

FIG. 10.

given for the power. This speed is a slow speed, and not a high speed.

The author found, without going to any extreme limits, that an ordinary drilling machine required, for the same rate of penetration with fast speed and fine feed, double the power required with slow speed and coarse feed, Fig. 8. This figure is taken from a paper by Mr. Dempster Smith, entitled "Experiments upon the Forces Acting on Twist Drills," read before the Institution of Mechanical Engineers in 1909. The curves show the torque and thrust of a 2-in. drill entering, fully entered, and with the feed disengaged.

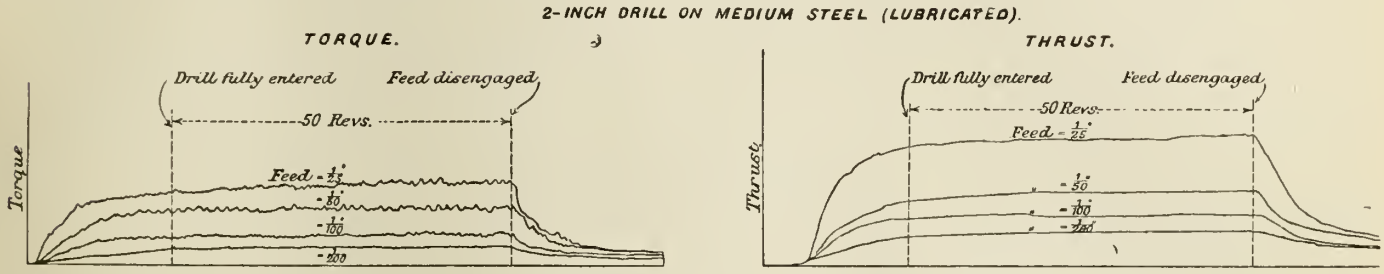

FIG. 8. DIAGRAM OF POWER CONSUMED BY A DRILLING MACHINE.

It will be noticed what a very large proportion of the power used for the finer feeds goes in friction when the drill is not cutting. These experiments were made with a drill in careful alignment with the work, and not, as may often be the case, with a pneumatic drilling machine supported by a springing arm and starting with the drill at anything but right angles to the surface of the work; conditions which would tend to increase the drill friction.

The result, as will be shown by what follows, is that the best effects are obtained by running the drill at slow speeds, and not at high speeds. The limit in this respect would be reached if the pressure required to feed the drill were more than could be conveniently given by the feed-gear, or if the torque exceeded the strength of the drill-body or cutting edge.

Fig. 9 shows a curve of the drop in pressure in a flexible hose 16½ ft. long and ½ in. diameter bore, with initial pressure 85 lbs. per square inch. It will be noted that at a flow of 70 cubic feet of free air per minute there is a drop of 20-lb. pressure per square inch. The flow of air was measured by means of a Venturi tube connected to a U-tube manometer, provided with a scale corrected for variations in the initial pressure of the air.

Now, it is evident that this drop in pressure has a very important bearing on the design of the tool, and may be employed to advantage. Let us take as an example the tests of a pneumatic drilling machine connected to the main supply by a length of 16½ ft. of hose of ½ in. internal diameter. As shown by table I., if the drill uses 70 ft. of free air per minute, and the pressure of air on entering the hose is 85 lbs., the pressure at the drill will only be 65 lbs.

When the air is allowed to flow into the drilling machine, a high speed of rotation is set up until the feed is applied by the feed-screw. The more rapidly the feed-screw is rotated, the quicker will be

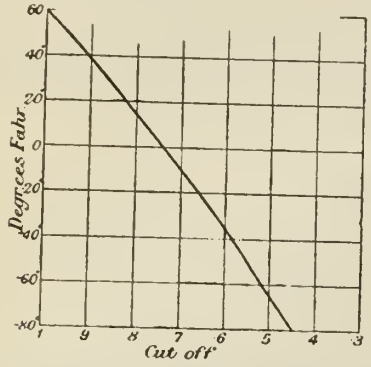

FIG. 11. TEMPERATURE AT EXHAUST WITH VARYING POSITION OF CUT-OFF, ASSUMING INITIAL TEMPERATURE 60° F., AND ADIABATIC EXPANSION OF PURE DRY AIR.

the penetration of the drill and the slower will the drill rotate, with the final limitation that if the feed is too rapid, the drill will stall suddenly and there will be no penetration.

This appears to be a curious paradox, for, apart from considerations of wire-drawing, the indicated horse-power of the pneumatic engine would seem to be dependent on its speed and the pressure of the air, Fig. 10. Since, however, the flow of air is decreased at the slower speed, the pressure rises and the torque increases. The result arrived at, therefore, is that the maximum speed of penetration is given by that speed of rotation at which the machine develops its minimum horse-power, but its maximum stable torque.

Considerable experience of running drills under test conditions has proved the importance of applying the feed with judgment. A man used to this work can get much better results out of a drill than can another man, equally intelli-

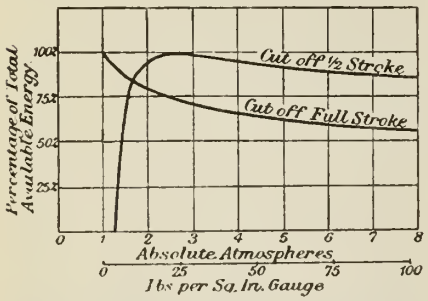

FIG. 12. PERCENTAGE OF AVAILABLE ENERGY USED WHEN WORKING NON-EXPANSIVELY WITH COMPRESSED AIR, AND WITH CUT-OFF AT HALF-STROKE.

gent and skilful, who is not so accustomed. It requires the greatest judgment in order to feed the drill so rapidly that it shall just, but only just, escape stalling. It has been found that the feed must be reduced slightly just before the drill breaks through the metal.

Perhaps at this point it may be well to mention that the above considerations apply only to those cases where the power given by the pneumatic tool is less than that which can be used by the twist-drill without requiring to be ground too frequently. With modern high-speed twist-drills of ½ in. diameter and above, this is practically always the case.

The idea of a minimum speed at which the pneumatic drill will run without stalling is of importance, because it should help to fix the gear ratio to be employed between the pneumatic motor and the twist-drill. As already shown, this critical speed is probably dependent not only on the size of the twist-drill and the material to be cut, but also upon the laws connecting the torque of the pneumatic motor with its speed of revolution, while this relation in its turn depends upon the pressure of air supply and the length and bore of the flexible hose.

However, let us consider for he moment that the critical speed is a constant, and is known. Let us suppose that it is 200 revolutions per minute. Then, if the relation of the horse-power of the pneumatic motor to its speed of revolution be known, the gear ratio may be designed so that the motor shall give out the maximum horse-power when the twist-drill is running at 200 revolutions per minute.

The history of other prime movers would indicate the probability that there will be, and should be, an increase in the number of revolutions of the pneumatic motor on drills. The advantages obtainable by such a change are almost self-evident. Everything is to be gained by obtaining increased power from the same piston by running it faster, provided the design still ensures reliability and good wearing qualities. However, if this change occurs, it will necessarily involve an increase in the gear ratio between the drill and pneumatic motor.

Perhaps it may be allowable here to point out a contrast between the humble "windy drill" and its more lordly cousin, the motor-car engine. In both cases the desire has been to get a larger output of power from a given size of engine: but, while the motor-car engine has been set to drive its attached machine at ever-increasing speeds, the unfortunate pneumatic engine is doomed to rotate its twist-drills at the minimum stable speed as long as the man in charge takes the trouble to work it at its full capacity. If the bore and stroke of the engine be fixed, the gear ratio should, therefore, be higher or lower, according as the maximum power is developed at a high or low speed.

It may be said that all pneumatic drills which are operated by pistons and crank-shafts at present run at very low piston speeds—indeed, lower than most slow-speed, steam engines. As in the case with the petrol engine, the difficulty is to get adequate valve area.

We have already seen how important is the effect of skill in feeding a pneumatic drill in order to make it give the best results. Let us trust that the future has not in store for us both professional racing drillers and specially-designed racing drills. However, if such be the case, we must picture to ourselves a machine with enormous valves and an abnormal gear ratio, so as to enable the pneumatic motor to run at an excessive rate while the twist-drill, fed downwards by a powerful feed motion, rotates at the lowest possible speed at which its motion is stable.

Page-Hersey Co. New Butt-Weld Pipe Mill, Fort William

The Fort William plant of the Page-Hersey Co. represents a faith in the increasing pipe and tube requirements of the Dominion of Canada, and is a tangible expression of their desire to meet the needs of our Canadian West, not only in kind and quantity, but in prompt delivery.

THE new plant of the Page-Hersey Iron, Tube and Lead Co., Ltd., at Fort William, Ont., is practically completed. This company now have three plants making butt-welded pipe—one at Guelph, Ont., the one mentioned above, and one at Welland, Ont. In addition to these plants making butt-welded pipe in sizes from ⅛-in. to 4-in., they have a lap-weld pipe mill at Welland, Ont., making lap-welded steam and line pipe tubing, drive pipe casting, also bell and spigot pipe, in all weights and in sizes from 2-in. to 10-in. They are also equipped to supply trolley poles, tarred and wrapped pipe and special bends. With the three mills, the company is in a position to furnish anything in the tube line, either standard or special on short notice, and with their improved equipment to guarantee that the output is of excellent quality. The Fort William plant represents a faith in the increasing tube trade in Canada, and the desire to supply their Western customers with quick delivery, by establishing a distributing point for the larger sizes of pipe, at which place a large stock will be constantly kept on hand.

The plant at Fort William is located at the corner of Montreal street and Neebing avenue, and has a fronting on the Kaministiquia River with dock facilities. The property comprises about twelve acres, and is reached by an industrial spur connecting with the G.T.P., C.P.R., and the C.N.R. The plant when running at full capacity will employ about 250 men.

Buildings.

The designs for the plant were executed in the company's engineering department at Welland, and the erection of the buildings was done by local contractors. The installation of all the machinery was under the direct supervision of the company's engineering department. The buildings comprise a producer and boiler house, 30 ft. x 60 ft.; a furnace building 70 ft. x 140 ft.; a finishing building, 70 ft. x 180 ft.; a galvanizing department, 40 ft. x 125 ft.; a machine shop, 38 ft. x 100 ft., and a pipe storage building, 60 ft. x 406 ft. All the buildings are of brick construction, except the producer house, galvanizing department, and pipe storage, which are of wood framing, sheeted and roofed with corrugated iron.

Skelp Yard.

The skelp yard is equipped with crane runway service, 440 ft. long, and a 10-ton crane of 70 ft. span. The skelp is transferred from the yard to the furnace by means of an industrial track system. The yard has sufficient storage capacity of plate for the various sizes of pipe made, and to meet the demands of rush orders of any nature.

Furnace and Welding Machinery.

The furnace is of the regenerator type. 8 ft. x 24 ft. hearth, and gas for heating same is supplied by three 10 ft. diameter stationary producers, hand stoked. In the boiler house is installed one Barrow combination boiler, which furnishes draught for the producers and supplies heat for the various buildings. A pair of clipping shears for forming and trimming the ends of the skelp, is located at the charging end of the furnace, and is operated by a Canadian-Westinghouse motor. These shears and the machinery for drawing the skelp from the furnace and welding same, the various rolls for sizing the welded pipe, and the movable racks for cooling the pipe, were all designed by the company's engineering department. This machinery is also all operated by Canadian Westinghouse motors.

Finishing Department.

The handling of the pipe from the welding department to the pipe storage, following the sequence of the different operations in the finishing of the pipe, is accomplished with trucks, equipped with roller bearings running on a track of 30-in. gauge.

There are twelve threading machines in this department, arranged in pairs. They are of improved design, insuring perfect threading and reaming of all pipe. One pair of the larger machines is equipped with a coupling screwing-on arrangement. The other five pairs of machines each have a separate mechanism to take care of this feature of the work. The machinery in this department is all belt driven.

All the pipe is given a thorough hydraulic test, for which is provided a 600 lbs. pressure triplex power pump, with individual motor, and an accumulator and intensifier to increase the pressure to 2,000 lbs. All pipe is given a test of from 400 lbs. to 2,000 lbs. depending on the requirements. The testers consist essentially of a bed 25 feet long, with a fixed head and movable tail stock, between which the pipe is held end to end and filled with water at the test pressure. From these testers the pipe goes to the measuring and bundling bench, and thence to the pipe storage, where it is loaded directly for shipment or put into stock.

Galvanizing Plant.

This department comprises pickling tanks, for removing all scale or foreign matter preparatory to the galvanizing process; dryers for drying pipe before immersing in the spelter bath; the spelter bath itself and drawing machinery for affording a clean, even exterior surface, and leaving the inside clear and smooth of all obstructions. The pipe in this department is handled by means of an underhung crane with two two-ton electric hoists, affording flexibility in handling, such as tipping the pipe for drainage.

The Machine Shop.

The machine shop building is a two-storey structure, the first floor being used for the mechanical department, and the second as a carpenter shop. The equipment of the shop is as follows:

1 22-in. engine lathe.
1 12-in. Cisco engine lathe.
1 Bertram shaper.
1 Radial drill press.
1 Mackenzie hack saw.
1 Norton grinder.

The forge shop is located in the welding department, while space 30 ft. x 38 ft. of the machine shop building is used as a transformer house, etc., the equipment being as follows:

3 panel slate switchboard, 65 in. x 30 in. x 2 in.

1 55 k.v.a. 1,200 r.p.m. synchronous motor direct connected to one 35 k.w. 250 volt compound wound, interpole generator.

3 75 k.v.a. oil insulated self-cooling, single phase, 60 cycle transformers; primary 220,000 volts, secondary 550 volts.

All of the above is of Canadian Westinghouse Co., Hamilton, manufacture.

Pipe Storage.

An industrial spur enters this building as a depressed track, and is paralleled by two tracks of 30-in. gauge, with storage racks on either side of the latter. By this method, loading from stock, or directly from production is possible with speed and ease.

The couplings for all the plants of the company are made at the Welland works, in order to insure absolute uniformity of product. The equipment there being of the latest type for welding and tapping. Couplings of all sizes.

tapers, recesses, and threads are made, including steam, line, drive, regular casings, and inserted joint casings.

All the pipe made by the Page-Hersey Iron, Tube and Lead Co., bears the trade mark, P crown H. rolled on each length of pipe. They are pioneers in the Canadian pipe industry, and their head offices are at the Traders Bank Building, Toronto, Ont.

U.S. PIG IRON PRODUCTION IN 1913.

THE total production of all kinds of pig iron in 1913, according to the Bureau of Statistics of the American Iron and Steel Institute, amounted to 30,966,301 gross tons, against 29,726,937 tons in 1912, an increase of 1,239,364 tons, or over 4.16 per cent. The production in 1913 was the largest in any previous calendar year. Combining the output in the first six months of 1913 with the output in the last six months of 1912, however, a total is reached for the twelve consecutive months of 32,143,265 tons, or 1,176,964 tons more than in the calendar year 1913. The following table gives the production of pig iron in half-yearly periods from 1910 to 1913, in gross tons, including several thousand tons of ferrophosphorus, ferrotitanium, ferrovanadium, and other alloys:—

	1910	1911	1912	1913
1st half	14,978,738	11,666,996	14,072,274	16,488,602
2nd half	12,324,829	11,982,551	15,654,663	14,477,699
Total	27,303,567	23,649,547	29,726,937	30,966,301

The production in the second half of 1913 shows a decrease of 2,010,903 tons, or almost 12.2 per cent., as compared with the first half.

Classified Production.

The production of Bessemer and low-phosphorus pig iron in 1913 was 11,593,385 tons, against 11,664,015 tons in 1912, a decrease of 70,630 tons, or about 0.6 per cent. In the second half of 1913 the production of Bessemer and low-phosphorus pig iron was 5,307,419 tons, as compared with 6,285,966 tons in the first half. The production of low-phosphorus pig iron alone in 1913 was a maximum, and amounted to 316,818 tons, as compared with 282,359 tons in 1912.

The production of basic pig iron in 1913, including a small tonnage of charcoal pig iron of basic quality, amounted to 12,537,746 tons, against 11,417,886 tons in 1912, an increase of 1,119,860 tons, or over 9.8 per cent. In the second half of 1913 the production was 6,027,735 tons, against 6,510,011 tons in the first half, a decrease of 482,276 tons. The production in 1913 was much the largest yet achieved, the year of next largest production being 1912.

The production of charcoal pig iron in 1913 amounted to 339,981 tons, against 347,025 tons in 1912, a decrease of 7,044 tons. A small quantity of pig iron made with charcoal and electricity is included in the figures for both years. In the first half of 1913 the production of charcoal pig iron amounted to 176,182 tons, and in the second half it amounted to 163,799 tons. No pig iron was made in 1912 or 1913 with mixed charcoal and coke as fuel.

The production of spiegeleisen and ferromanganese in 1913 amounted to 229,834 tons, against 221,724 tons in 1912, an increase of 8,110 tons. The production of ferromanganese alone in 1913 amounted to 119,496 tons, against 125,378 tons in 1912. Of spiegeleisen alone the production amounted to 110,338 tons in 1913, against 96,346 tons in 1912. In addition to the above, 3,332 tons of ferrophosphorus were produced in 1913, against 6,697 tons in 1912.

The production of bituminous coal and coke pig iron in 1913 reached a maximum of 30,348,973 tons, as compared with 29,132,733 tons in 1912, an increase of 1,216,240 tons, or about 4.2 per cent. In the first half of 1913 the production was 16,107,845 tons, and in the second half 14,241,128 tons.

The production of mixed anthracite and coke pig iron in 1913 amounted to 254,901 tons, as compared with 236,467 tons in 1912, an increase of 18,444 tons. In the first half of 1913 the production amounted to 193,084 tons, and in the second half it amounted to 61,817 tons. The production of pig iron with anthracite coal alone in 1913 amounted to 22,446 tons, as compared with 10,712 tons in 1912.

Furnaces in Blast and Building.

The whole number of furnaces in blast on December 31, 1913, was 205, against 304 on June 30, 1913, and 313 on December 31, 1912. The number of furnaces idle on December 31, 1913, including furnaces being rebuilt, was 257, against 160 on June 30, 1913, and 153 on December 31, 1912. The number of furnaces actually in blast for a part or the whole of the last six months of 1913 was 330, against 348 in the first half of the year. In the last half of 1912, 337 furnaces were active, against 302 in the first half.

On December 31, 1913, there were three entirely new furnaces in course of construction, all of which will use coke fuel, as follows:—Pennsylvania, 1, and Minnesota, 2. They will have a total annual capacity of 505,000 gross tons of pig iron. In addition, eight furnaces were being rebuilt on that date.

In 1913 there were five entirely new furnaces built, four coke and one charcoal, with an annual capacity of 596,000 gross tons, as follows:—Pennsylvania, 2; Virginia, 1; Ohio, 1, and Mississippi, 1 (charcoal). In addition, one charcoal furnace in Georgia, with an annual capacity of 13,500 tons, was revived.

During 1913 there were 10 blast furnaces abandoned or dismantled, with a total annual capacity of 316,000 gross tons, as follows:—New York, 1; Pennsylvania, 4; Virginia, 2; Tennessee, 1; Ohio, 1, and Michigan, 1. When last in blast, two furnaces, with an annual capacity of 29,000 tons, used charcoal, and eight furnaces, with an annual capacity of 287,000 tons, used mineral fuel. Some of these furnaces had been idle for many years.—Iron Age.

MODERN GEARING.

MR. H. HUBERT THORNE, in a paper read before the Junior Institution of Engineers recently on Modern Gearing, said: The subject had not received the serious consideration of many engineers, partly because of the belief (due to the very indifferently manufactured gears of even recent date) that all gears were inefficient, and partly because a very considerable amount of time must be given over to test and study if the subject were to be mastered. The involute possessed advantages over the cycloidal tooth for general use, as the centres of a gear could be varied to some extent, and still the latter would mesh properly. All that happened when the centres were extended was that the pitch point was moved nearer to the outside of the teeth, the pitches being correspondingly increased. This was a very useful property of the involute, and today this form was almost universally used; so, when speaking of gears, he would consider only involute gears.

The introduction of high-speed motors and the general speeding-up of machinery introduced new problems to the engineer, and he set about to find a gear which would run at a high velocity without undue noise and vibration, and one which would give a fairly high ratio of reduction in a single pair of wheels. Two ways of getting over the difficulty presented themselves—one by using pinions of special materials which would not create noise when running with metal wheels, and one by altering the form of the teeth. The former method was adopted for many drives, and pinions of raw hide, compressed paper, compressed linen, fibre, etc., had all been tried, but on account of the large diameters necessary to accommodate rivets between the bottoms of the teeth and the bore, the wheels became unduly large and heavy, and the ratios obtainable only small. The latter method had also been largely adopted, particularly within the last decade, and had resulted in the develop-

ment of two distinct forms of gearing—the first worm gearing, and the second double helical gearing.

Worm Gearing.

Worm gearing was quiet in operation, and could be made with ratios as high or even higher than 100 to 1, but owing to the fact that the rolling action of the correct spur gear gave place to a rolling and rubbing action between the worm and the wheel, the speed of the worm must not exceed comparatively low limits, determined by the conditions under which it had to work; and, further, the efficiency went down as the ratio increased, and a high ratio worm gear was not by any means an efficient mechanism. The reasonable adoption of worm gears was consequently restricted to comparatively small powers, speeds and ratios. For such gears, having both shafts mounted in ball bearings, efficiencies of 95 per cent. were readily obtainable.

Helical Gearing.

For high powers and speeds some other form of gear must be looked for than worm gears. The single helical gear possessed the great disadvantage that end thrust was set up along the shafts (a disadvantage also inherent in worm gears), and to overcome this, two single helical gears of opposite hands were riveted or bolted together, thus forming the double helical gear. This type of gear, which was not now built up from two single helicals, but cut direct from the solid blank, was often manufactured with a ratio of 25 to 1 in a single reduction.

By comparison, the variation of stress on the teeth was very much less with the double helical than with the straight tooth, and consequently the former was the stronger. With double helical gears the average engagement was spread over an area, the limits of which were comparatively near the pitch line, and the action became more nearly a pure rolling one, and the rubbing action, which must produce wear, was reduced to a minimum.

With spur gears, particularly when the pinion had only a few teeth, a distinct knock was noticeable, as the load was repeatedly applied along the whole length of the tips of the teeth, whereas with double helical gears, however small the number of teeth in the pinion, the engagement at the top of the tooth could only occur at a particular point or points of the face at any one time, the average engagement being always near to the pitch line. Owing to the elimination of most of the losses due to sliding friction, practically the whole power put in was transmitted through the gear, and from actual tests it was ascertained that with a ratio of 20 to 1 in a single train, the efficiency was 98½ per cent.

Many double helical gears were now running at ratios of 25 to 1 and over, the only limiting factors being the diameter at the root of the pinion teeth, necessary to resist torsion and bending, the capacity of the machine on which the wheel was to be cut, and the space available. The diameter of the pinion was only limited by the necessary root diameter, because, as previously stated, by suitably increasing the face width of the pinion any desired number of teeth would be in engagement at one time.

BOILER EXPLOSION AT OTTAWA.

A DISASTROUS boiler explosion occurred on the morning of January 21 at the Howick Hall, Ottawa, when three men were killed, five severely injured, and several valuable horses perished. The Eastern Ontario Live Stock Show was being held at the time, which accounts for the presence of the horses. The hall is a steel and concrete structure, with an annex, about 150 yards square at one end, built of wood. It was under this section that the boiler and heating plant were located.

The boiler was of the return tubular type, 60-inch diameter by 14 ft. long, and had 82 3-inch tubes. It was made of Carnegie steel plate of 60,000 T.S., 5-16-inch thick, the heads being ⅜-inch thick with 1⅛-inch longitudinal stays. The longitudinal seams had double riveted lap joints with ¾-inch rivets, 2⅞-inch pitch. The girth seam was a single-riveted lap joint having ¾-inch rivets, 2 1-16 inch pitch. The safety valve was of the lever and ball type, 3½-inch diameter. The boiler failed at the manhole ring, which was of cast iron, and through the front shell plate in a longitudinal direction.

At the official enquiry, held to investigate the cause of the explosion, the jury brought in a verdict to the effect, "that the explosion was caused by excessive steam pressure and that the safety valve and steam gauge were defective." According to the specification, the boiler was good for 65 pounds working pressure, but it had been operated at a lower pressure, usually around 20 pounds, and was used for supplying steam to a low pressure heating system. We are indebted to Mr. D. M. Medcalf, chief boiler inspector of the Province of Ontario, for the constructional details and accompanying photographs. Mr. Medcalf made an examination of the wrecked boiler on behalf of the Provincial Government.

Cleaning Producer Gas.—The cleaning of producer gas by straining it through a porous diaphragm of fine-spun glass was recently described before the American Society of Mechanical Engineers in a paper by Mr. H. F. Smith. Both gas and tar pass through the diaphragm, but in passing, the tar particles coalesce into large drops which cannot be carried along with the gas current. By means of this process any desired degree of gas cleanness can be secured. Water or other washing fluid is not required, and the process is not one of filtration.

Mechanical Stoking of Locomotives.—It was inevitable that when a satisfactory mechanical stoker for large locomotives was developed, it would have extended application. We understand that one large locomotive stoker Company has at the present time over 400 stokers in regular operation on locomotives in the United States, and that 200 of these are in use on the Baltimore & Ohio Railroad.

MAKING PACKING AIR TIGHT.

By N. G. Near.

HAVE you ever had trouble keeping the packing of a hand pump perfectly air tight? Where the packing is leaky, you usually have a hard time making the pump "catch" without priming it. Here is a simple method for assuring air-tightness—make an oil-seal.

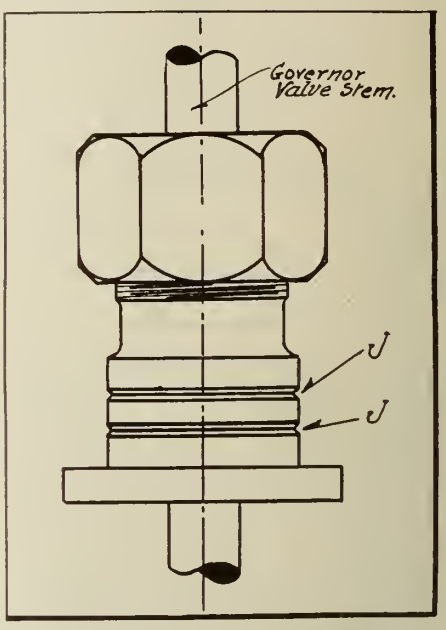
MAKING PACKING AIR-TIGHT.

An oil ring can be easily attached to the stuffing box cap by sweating on, or in a hundred other different ways; all that is necessary being to make the joint leakless. Pour in a fairly heavy lubricating oil, and as long as any of the latter remains in the cup you have thus fashioned, you may be assured that the packing is tight. If gasoline be the liquid pumped, lubricating oil will not harm it, in fact, lubricating oil is a good thing to mix with gasoline for use in connection with reciprocating gasoline engines.

TENSION ON CYLINDER COVER STUDS.

By J. Roy Brodie.

IN the February 5 issue of **Canadian Machinery** there appears a question which I believe was up for discussion some years ago. Mr. Jones, who was the originator of the problem, thought there would be no increased tension on the studs till the steam cylinder pressure exceeded 100 lbs. per square inch. Now, if the above pressure causes increased strain, I cannot understand why any pressure lower would not have the same effect in proportion.



I do not consider it necessary to explain my theory with diagrams for the reason that I agree in every particular with the theory of Mr. J. H. Rodgers, but will add a little to his theory with the hope that it may aid in a more thorough explanation of the question before us. For instance, let us suppose the face plate was secured to the flange by studs having a tensile strength of 50,000 lbs. per square inch or sectional area, and if each bolt had a sectional area of a ½ square inch, the total strength of each bolt would be 25,000 lbs. With ten bolts, the total resistance to strain would be 25,000 $\times 10 = 250{,}000$ lbs. The pressure exerted on each stud bolt by screwing up the nut being 1,000 lbs., therefore, on ten bolts the total pressure would be 10,000 lbs. The total pressure of steam on the face plate would be 100 sq. in. $\times$ 80 lbs. per sq. in. $=$ 8,000. Deducting the combined effective forces of screwing up and total steam pressure on face plate—$10{,}000 + 8{,}000 = 18{,}000$ lbs., from 250,000, we get 232,000 lbs. excess strength of stud bolts.

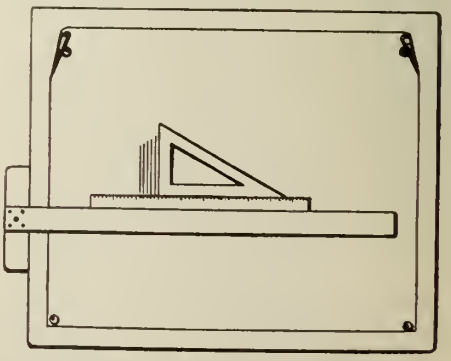
It is not reasonable to suppose that any pressure short of that required to elongate or fracture the stud bolts will lessen the screwing-up pressure. The tension on the stud bolts caused by the screwing-up strain is, therefore, constant, always tending to pull them apart or break them, whether live steam be in the cylinder or not. When steam at any pressure is admitted to the cylinder and comes in contact with the face plate or cover, the tensile strain on the stud bolts is increased proportionately, and is equal to the area of the face plate in square inch multiplied by the pressure per square inch. Now, the two forces as they affect the stud bolts act in the same direction, both causing a tensile strain outward, consequently they cannot balance each other, and, as there is nothing else to support this strain, the duty is fulfilled by the stud bolts, a conclusion about which there can be no doubt.

LEAKY STUFFING BOX REMEDY.

By J. E. McCormick.

ON an old engine, the governor spindle stuffing box had been turned to tightly fit into the hole drilled for it in the top of the governor valve chamber and had been thus forced into place, but after long service it had become so loose as to develop a disagreeable leak. I remedied the latter by cutting two grooves as indicated in the sketch. As a small ridge was formed on each side of each groove. it increased the diameter between these points, and by going lightly at first and frequently trying it in place, a snug fit was easily secured at both grooves and the part again forced into place. By fitting and finishing the

LEAKY STUFFING BOX REMEDY.



lower groove first, I was able to fit each groove independent of the other.

This repair was made three years ago, and although no lead or other substance was used, there has been no leaking since. I believe this method of "expanding" may be adapted to some other items of repair work where a tight fit is required in a joint requiring no movement between the parts.

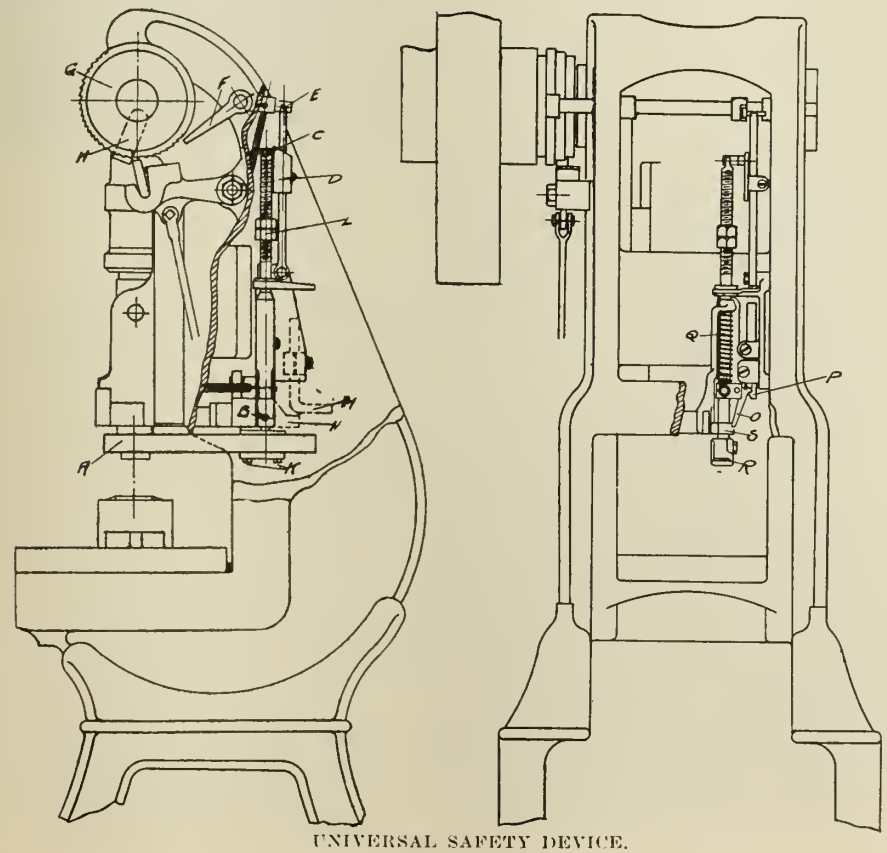
SPACING LINES ACCURATELY.

By N. G. Near.

I SUBMIT herewith a little time-saving drafting kink that I have found useful many times. The drawing, I believe, makes the matter clear. I lay an

SPACING LINES ACCURATELY.

ordinary scale against the T-square as shown, and, from the graduations on the scale, draw my parallel lines with perfection and despatch. Inasmuch as there are many different kinds of scales in the world, carrying a multitude of graduations—English, metric, printers, tenths and hundredths of an inch, etc., it is evident that this scheme is quite universal of application; besides, the undesirable feature of pricking holes in the paper, often resorted to, is removed.



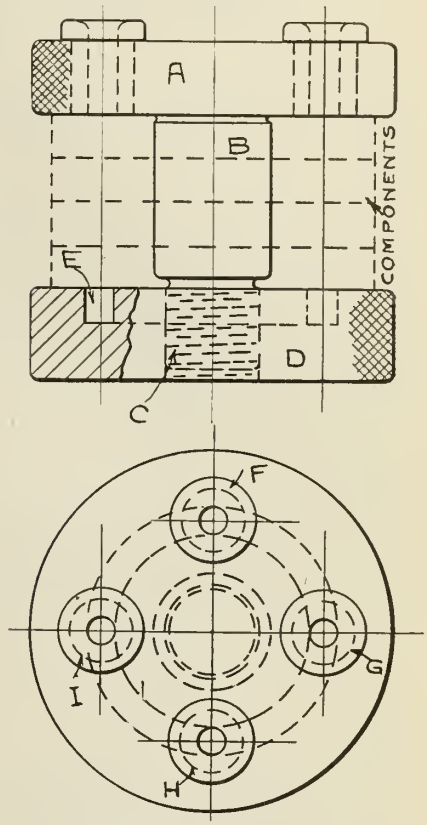
UNIVERSAL SAFETY DEVICE.

THE illustration shows power press equipped with a safety device for protecting the operator when feeding the work. The device consists primarily of a guard built round the punch and connected to the driving mechanism. The guard moves down ahead of the punch, and upon meeting any obstruction such as the operator's fingers, immediately stops the ram. In operation, the guard (A) which is connected to the ram is automatically released and travels in advance of the punch. Upon meeting an obstruction, the guard tilts the vertical rod pivoted at (B), and roller (C) comes in contact with bar (D) upon which pin (E) is resting. When (E) is released, the spring pulls pawl (F) down, which engages with the ratchet ring (G) and is driven by end of clutch pin (H). The ring being held causes the clutch to release and so immediately stops any further movement of the ram.

screwed firmly into position on the threaded nose (C), thus, the jig is brought into position for work.

The illustration shows the ram in the top position. When it travels down, it carries rod (S) with it, at the same time catch (O) is released by catch (P), permitting it to fall, accelerated by spring (Q) and moving the guard 1¼ inch in advance of the punch part of the way, after which they travel down together, the guard always in advance of the punch. The lock nuts (L) are adjusted so as to prevent the guard travelling too far and striking the die. On the return or upward motion, the ram carries rod (S) with it which engages with catch (O), pushing the rod up, the guard travelling with it. This arrangement is only fitted to long stroke presses. For short stroke presses an arrangement is shown by dotted lines in which projection (N) upon coming to the top of the stroke, strikes bracket (M) and presses down the back of the guard causing it to tilt in front. This arrangement prevents the guard from obstructing the operator when feeding the press and also allows the front of guard to fall at the beginning of the stroke and travel ahead of the punch. The guard in either type is adjustable length-ways by cap screws (K), and vertically by clamping device (R).

This Universal Safety Device has been patented in Canada, the United States, Great Britain and several foreign countries by the proprietors the Wright-Stacey Protection Co., Hamilton, Ont.



UNIVERSAL SAFETY DEVICE.

A USEFUL DRILLING JIG.

By W. G.

THE drilling jig herewith described is of very simple construction, and if properly made should turn out work

A USEFUL DRILLING JIG.

of first class quality. The jig in question was used for drilling peg holes in a number of circular discs, 2¾ in. dia. by 3/16 in. thick. The holes in the said discs had to be interchangeable with each other, so that when one disc became worn it could be replaced by another. A glance at the accompanying drawing will no doubt give a clear idea of its general construction, the upper view being part sectional elevation, while the lower view represents the plan. The bush plate (A) is preferably made from a piece of good quality mild steel, and consists of a circular knurled disc having a reduced locating bung or stem part (B). It is further provided with a screwed end (C) for the purpose of securing it to the base (D); the latter consisting of a circular knurled mild steel disc having a central tapped hole for the purpose of securing it to the screwed nose (C) of the bush plate (A). It is also provided upon its inner face with a recess (E), the object of the latter being to provide clearance for the drill when in operation. The bushes (F), (G), (H), (I), should be made from best cast steel and carefully hardened and ground. The sequence of operation is as follows:—

The components (see dotted lines in upper figures are first passed on to the locating bung (B); the base (D) is next

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Attention is drawn to the accompanying course in arithmetic, a concurrent study of which is recommended with that of the Question and Answer Series.

Question.—Will you be good enough to supply the following information through your question and answer department. What is the prevailing general method and the formulae used in the process of galvanizing iron?—A. McK.

Answer.—There are three methods of galvanizing iron in general use at present, viz., hot galvanizing or the process of immersing the iron in a bath of molten zinc; the cold process or electro-galvanizing by means of the electric current and a suitable electrolyte; and the vapor method which consists of subjecting the articles to be treated to a vapor of zinc while revolving in a rotating enclosed chamber in a furnace. Each method has its peculiar use and advantages, and the results obtained are very satisfactory when the respective operation is properly attended to.

Certain fallacies existed for a long time as to relative merits of the different processes. The cold or electrolytic method was found to be too slow and costly, and the results were erratic and not satisfactory. As a consequence, the process was soon discarded for the hot method, but the difficulty of management in connection with large baths of molten zinc, the deterioration of the bath and other mechanical causes limited the process to articles of comparatively small size and weight. The electro zincing process on the other hand has been subject to many patents and there are now two companies on this continent who manufacture and install the mechanical equipment and solutions with which the most difficult casting or iron object may be satisfactory coated by the electrolytic method.

The hot or molten process consists of first removing the scale oxides and grease from the article to be treated, and the immersing the article dry in a bath of molten zinc varying in temperature from the melting point to 900 degrees Fah. according to the thickness of the coating desired and the nature of the work being treated. A high temperature produces thin coatings while low temperatures allow of thicker coverings. This method of regulation is unsatisfactory as at high temperatures more zinc combines with the iron to form dross and this must be removed frequently. For this reason it is customary to operate the bath at as low temperatures as possible and to remove the excess of zinc by jarring or by a shaking motion immediately upon removal from the molten metal.

The electrolytic method consists of suspending the article to be treated in a bath composed of 2½ pounds of zinc sulphate dissolved in 1 gallon of water, together with 1 ounce of sulphate of aluminum which is added by thorough stirring. The article forms the cathode and the thickness of the coating depends upon the length of time it is treated and the volume of current used. It is advisable to equip the bath with plenty of pure zinc anodes and to allow it to remain at rest for at least 12 hours after preparing same, thus freeing the solution of any excess of acid. The temperature of solution should be maintained uniform, and never below 45 degrees Fah. When deficient in metal, add more zinc sulphate, and when the deposit produced is dark colored, add more aluminum sulphate. Operate the solution with a tension of from 5 to 6 volts, and keep the bath at about 18 or 20 degrees Beaume. Use as strong current as possible without interfering with the adherent qualities of the deposit. If the coating has a tendency to flake at lower edges, reduce the flow of amperes. Usually from 15 to 75 amperes per square foot is sufficient range to cover the various classes of work. The latter is prepared in the same manner as for electro-plating with other metals and must be clean, with all trace of acids removed from the pores of the metal to be treated before entering the zincing solution. If such precautions are not taken, black spots will remain and spoil the finish. Boiling in strong lye is an effective method of removing the acid from the pores. Use a large anode surface and keep them clean, or otherwise the bath will become exhausted of metal and the solution be rendered acid.

A solution consisting of 2 pounds zinc sulphate, 2 ounces aluminum sulphate, ¼ ounce glycerine and 1 gallon of water is also in general use and produces a very smooth durable deposit. The many advantages of the electrical process as in use to-day make it especially commendable to the manufacturer. The consumption of zinc is less than by the molten method. Threaded parts are handled equally as easily as plain surfaces. The deposit withstands the most severe test, and the treatment is a pleasant operation which may be carried out in any plating room. The usual cause of failure is a depleted solution, and if this point is remembered there should be no difficulty in electro-zincing any article of cast, wrought or sheet iron of reasonable size or shape.

The vapor process is not in general use in this country being still in the experimentnl stages. In Europe it is regarded, however, as superior to the electro method and is being employed by several large concerns. No doubt it will eventually find its way into the industries of this continent, as the principle of the treatment is well founded. Thus far, the various processes of vaporizing iron are covered by patents.

* * *

Question.—Give a definition of the mechanism as expressed by the word **Turbine.**

Answer.—A turbine is a prime mover in which gradual changes in the momentum of a fluid are utilized to produce rotation of the moving members.

* * *

Question.—Explain the difference between a turbine as above described and a rotary engine.

Answer.—In order to fulfil the requirements embodied in the answer to the first question, the only method suitable in practice for communicating the fluid energy to the rotor parts is to occasion a change in the fluid velocity. It should, therefore, be noted that pressure plays no part in the operation. A rotary engine on the other hand depends for its action on pressure, and in consequence is a mechanism entirely distinct from the turbine.

* * *

Question.—What is understood by the **Load Factor** in an electrical installation?

Answer.—The load factor of an electrical power plant or any unit of it is the ratio of the average output to the maximum. Thus, if, in an electrical installation, M=the maximum kilowatt output, and K=the total output in N hours, then the load factor for that period is $\frac{K}{M \times N}$. As this is commonly expressed as a percentage, the load factor $= \frac{K \times 100}{M \times N}$. The period usually taken is one year, therefore the load factor $=$

$$\frac{\text{Total Units Generated} \times 100}{\text{Maximum Load} \times 24 \times 365}$$

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

GRIDLEY AUTOMATIC MULTIPLE SPINDLE DRILL.

THE Gridley Automatic Multiple Spindle Drilling Machine is in essence a vertical turret machine for drilling, reaming, counterboring, and facing parts. Its radical features consist in the spindles being adjustable both radially and circumferentially, enabling the locating of all spindles at a common centre or at different points. Holes can be drilled cutting into each other or as far apart as the capacity of the machine will allow. The spindles are individually adjustable so that any tool may be placed in a position to act upon any point or to any depth regardless of the position of the other tools. As all of the spindles are supported from the centre column around an entire circle, the thrust on one side being balanced by the thrust on the opposite side, the centre column receives no undue strain and any spring due to heavy feeds is eliminated.

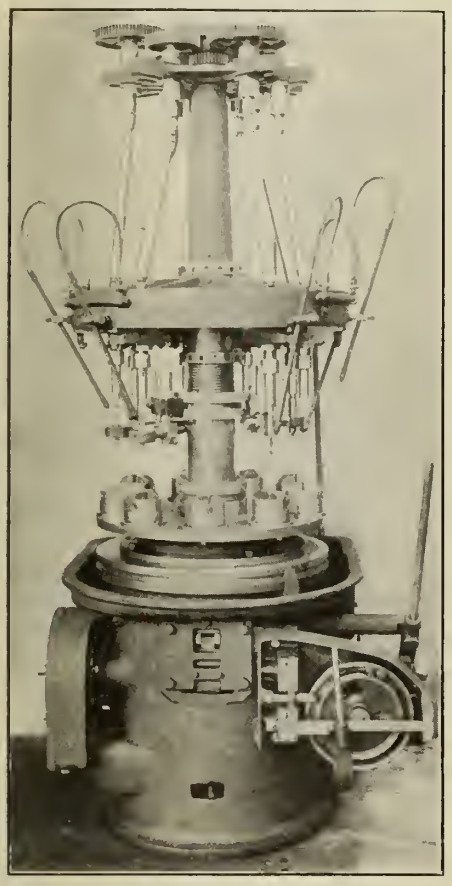


FIG. 1. GRIDLEY AUTOMATIC MULTIPLE SPINDLE DRILL.

The work is held in chucks or suitable fixtures on a rotating work table which revolves around the centre column, and, as it is necessary to have one position at the table idle for the purpose of removing the finished piece and inserting a blank, one more chuck or fixture is used than there are spindles. In Fig. 3 it will be noticed that the blank has been placed in the fixture ready for indexing. The die in the fixture at the right is finished and will be removed when the table has advanced one point, bringing it into position at the loading space.

As many spindles can be built into the machine as may be required by the class of work to be operated upon, from five to nine being the usual number needed. In order to divide the time of the various operations into as nearly a uniform unit as possible, it is sometimes advisable to use two or more spindles working in the same hole, each doing its proportion of the whole depth.

The table indexes one point each time it is lowered from the tools, and one finished piece of work results each time the table moves upward. The time taken to produce the piece, as in the Gridley Automatic Multiple Spindle Screw Machine, is that of the longest operation plus the idle time required to bring the work to the tools in the next position. Each spindle can be geared to the right speed for the tool which it carries, and in cases where extra heavy service is required of one or more tools, special heavy spindles can be used for these operations. In drilling a layout of holes, to insure an accurate spacing between them, two methods of holding drill bushings are used. When only a few drills or other tools need guide bushings, holders with adjustable vertical and horizontal arms are used. When a large number of holes are to be drilled, a plate is furnished extending around the centre column between the work carrying table and the spindles. In this plate are large holes, one in line with each spindle.

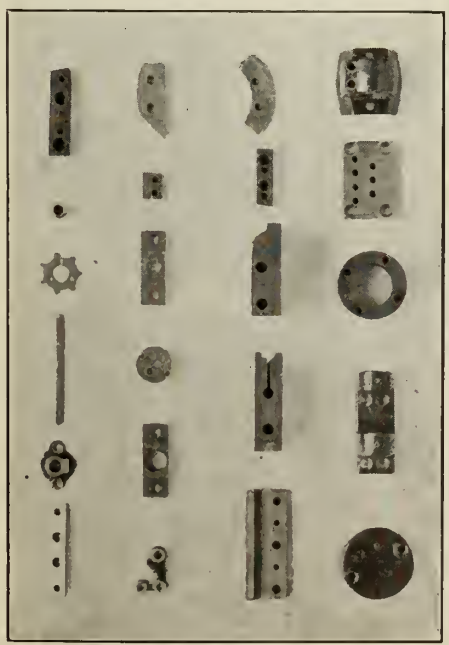

FIG. 4. WORK ADAPTED TO MULTIPLE SPINDLE DRILL.

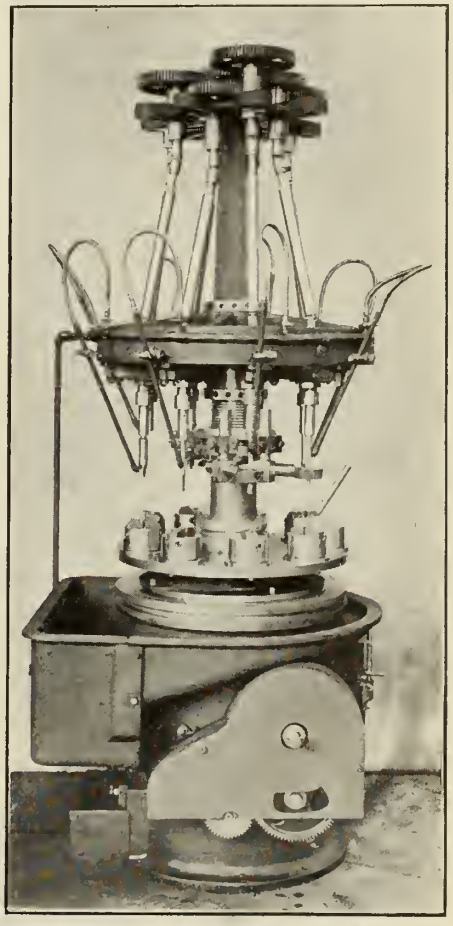

FIG. 2. GRIDLEY AUTOMATIC MULTIPLE SPINDLE DRILL.

Over these holes are clamped small adjustable cast iron bushing holders which can be quickly set to the required position. In changing from one job to another only the bushing holders are changed, and on some classes of work it is necessary to change but one or two of these. For drills and some other tools, hardened steel bushings are used. On other tools with only short flutes, bronze bushings are furnished. These give no trouble at high speeds, and, besides locating the tools, prevent chattering.

There is little difficulty found in setting the machine for operation on

different pieces of work; the tools being inserted in their holders. A perfect sample of the exact size and finish of the piece to be made is placed in the chuck or fixture, and the table advanced by hand until the piece is located at the spot under the first spindle where the operation commences. The spindle is then swung into exact position, and the guide, either bushing holder or bracket, securely fastened. After raising the table to its highest cutting point, the spindle is adjusted vertically to secure the proper depth of the hole. This operation is repeated until each tool is properly located. Then, by referring to the table of spindle speeds, the proper gears are placed on the centre shaft and spindles and all brought into mesh. Located on the lower left-hand side of the machine are the change gears which give the different speeds to the vertical centre shaft. Also here are located the feed gears giving the different tool feeds to the table.

After the proper speed and feed gears are in position the table is brought up to the position where the first tool of the set to cut nearly touches the work. At this point a cam-pin on the operating disc is set to throw out the fast feed clutch. This allows the feed gears to drive the table at the proper tool feed. After the table has reached its highest point and the tools are through cutting, the second cam pin on the operating disc is set to throw in the fast feed clutch. The machine is then ready to start, and each time it indexes, a blank is inserted.

The machine is provided with gear-driven oil pump, oil tank, and separate oil supply with adjustable nozzle to each spindle. Ample drip room is provided with self-draining drip tank, strainer and room for removing chips without disturbing the oil guards. The Windsor Machine Co., Windsor, Vt., are the designers and builders of this machine.

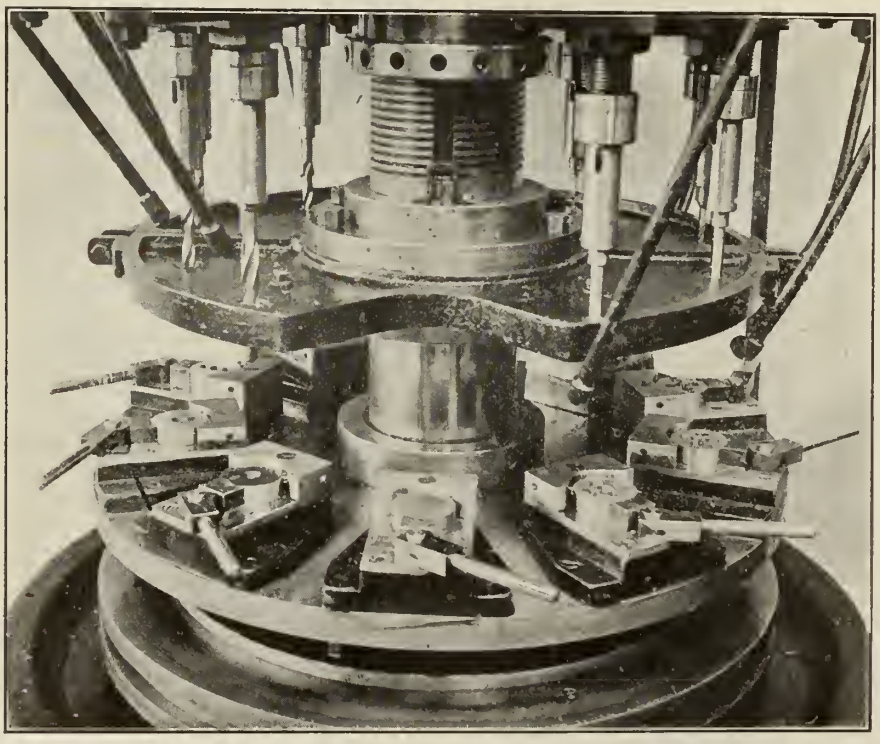

FIG. 3. GRIDLEY AUTOMATIC MULTIPLE SPINDLE DRILL.

THE LENNOX SERPENTINE SHEAR.

THE Lennox Serpentine Shear, a new type of machine now being offered by Joseph T. Ryerson & Son, Chicago, is designed particularly for the straight and irregular cutting of sheets and plates. The frame is a steel casting of spiral construction designed to provide sufficient clearance for material of unlimited length or width. This machine will handle not only straight cutting but also in or out curves having a minimum radius only slightly larger than the diameter of the blades. The spiral steel frame carries all gearing and is mounted on a substantial cast-iron base. All gears have teeth cut from solid metal and are provided with cast-iron gear guards so the workman is fully protected while operating the machine.

The blades which are made of high-grade tool steel, are set in approximately a horizontal plane. This gives a very large cutter bearing on the sheet or plate, and consequently there is very little distortion in the cutting. The upper cutter is positively driven, while the lower cutter is mounted in an adjustable sleeve, so that its position may be varied to allow for different thicknesses of material and for redressing. In addition to this, a cam is provided so that the lower blade can be dropped enough to permit the removal of sheets without reversing the machine. The cutters have a flush fastening to the shaft so that no nut projects to interfere with the handling of the work and the knurled edges feed the sheet automatically into the machine. A tool steel pin is provided to take up the end thrust on the lower cutter shaft. Where a number of sheets are to be cut to the same pattern, a template may be bolted to the work and this template followed by guiding against the top cutter.

LENNOX SERPENTINE SHEAR.

The machine is driven by means of a two-speed pulley, giving slow speed for intricate curve cutting and high speed for straight work. The main drive shaft is extended and squared on one end so that a hand crank may be used if power is not available. This shear, it is claimed, will reduce cutting costs fully one-half, by replacing old style hand and power cutters.

The shear illustrated has a capacity for cutting No. 10 gauge material and lighter, while other sizes having capacities of No. 16 gauge, ¼ inch and ⅜ inch material can be furnished. All machines are arranged for either belt and hand power or direct motor drive

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

E. H. Verner has just been appointed city engineer at Port Coquitlam, B.C.

J. Antonisen, C.E., has tendered his resignation to the Brandon Street Railway Co.

C. H. Topp has been appointed engineer for the municipality of Esquimalt, B.C.

George Kennedy, superintendent of the Massey-Harris Co., Toronto, plant, is seriously ill.

J. C. Dietrich, of Galt, will go to Welland to inquire into the industrial possibilities there.

E. R. Bingham, O.L.S., has been appointed corporation surveyor for the City of Port Arthur.

P. D. Yates, Toronto, has been appointed manager of the St. Catharines, Ont., Hydro-Electric Commission.

F. L. Buckley, general manager of the British-Canadian Lumber Corporation, left recently for Great Britain on a business trip.

R. E. Harris, president, Nova Scotia Steel and Coal Co., was in Montreal recently, as was also Thomas Cantley, general manager.

F. R. Newman, manager of the Canadian Fairbanks-Morse Co., Toronto, sailed from London, Eng., yesterday, where he has been on a holiday.

W. P. Hinton, general passenger agent of the G.T.P., has been appointed assistant traffic manager of the system, with headquarters at Winnipeg.

George D. Mackie, town engineer of Swift Current, Sask., has been appointed commissioner for Moose Jaw, Sask., at a salary of $4,000 per year.

I. G. Haekel, representing the Commercial Cars, Ltd., Luton, England, is in Vancouver looking for a suitable site for the erection of a motor truck factory.

W. L. Foster, Toronto, who is representing the Carbic, Ltd., of London, Eng., is sailing this week for the Old Country on a business trip and will be away about six weeks.

James DeVon, formerly specialist with the Taylor Instrument Co., Rochester, N.Y., has been appointed Canadian representative for the Thwing Instrument Co., Philadelphia, Pa., with office in Toronto.

M. J. Butler, of Armstrong-Whitworth of Canada, Ltd., left Montreal, February 19, on a visit to the works of the parent company in England. He expects to be back in Canada about the latter part of March.

F. Ditchfield has resigned his position as general superintendent of the Canadian Car and Foundry Co., Ltd., in order to become associated with the Mechanical Engineering Company, Ltd., Montreal.

Hon. Frank Cochrane, Minister of Railways, Ottawa, leaves on Thursday for a two months' trip to Great Britain and the Continent in the interest of his health. He will be accompanied by Mrs. Cochrane.

WHO'S WHO.

A. H. JEFFREY,
Manager and Secretary, Polson Iron Works, Ltd., Toronto.

Goodwin Shenton has been appointed manager of the Winnipeg, Vancouver and Victoria branches of John Millen & Son, Montreal. Mr. Shenton is a native of Winchester, England. Coming to Canada in 1911, he joined the railway supply department of John Millen & Son, latterly acting as assistant to Mr. F. D. Lyman, the manager of the department.

George Albert Kieffer, of Kieffer Bros., machinists, Montreal, died on Monday, Feb. 8, after three weeks' illness.

John Coates, the founder and chairman of the engineering firm of John Coates, Limited, of Westminster, died in London, England, at the residence of his daughter. The deceased had recently returned from Ottawa, his advice having been sought in connection with the municipal plant there. He lived in Ottawa for sixteen years, where he played a prominent part in political and social life.

J. Frater Taylor, president of the Lake Superior Corporation, speaking on the subject of a fifty-cent per ton bounty on iron ore recently, before the members of the Sault Ste. Marie Board of Trade, criticized the statement made in a resolution sent by the Fort William Board of Trade to Toronto, in which it was said that there is a great deal of iron ore unnecessarily being imported into Canada from the United States. "You can rest assured," Mr. Taylor said, "that if we had the raw material at our back and could get it as cheaply as we can get it in the United States we would not be importing it. The Algoma Steel Corporation is at present importing 600,000 tons yearly, and with the installation of a fourth blast furnace which will take place in the near future one million tons will be required."

Railway Club Banquet.—The Central Railway and Engineering Club of Canada celebrated its eighth anniversary by a banquet on Monday evening, Feb. 23, at the Grand Union Hotel, which was attended by over two hundred members and guests. Mr. Thomas was toastmaster. After the toast to "The King" the following toasts were honored: "The Empire," by W. R. McRae and C. A. Jefferis; "The Central Railway and Engineering Club," by G. Baldwin, R. Patterson and A. M. Wickens. Among the guests present were: W. McIntosh and G. E. McIntosh, Stratford; C. R. Curry, Brockville; J. F. Franey, A. W. Crouch and J. B. Wilson, Toronto.

The Independent Pneumatic Tool Co., Chicago, Ill., are distributing circular "U," just off the press, which describes and illustrates the "Thor" roller-bearing piston air drills, grinders, chipping and riveting hammers, and electric drills, etc. Individual illustrations are given for each size, and a table is included giving general specification and capacity of all types and of each size. Copies will be gladly sent to interested readers.

INDUSTRIAL NOTABILITIES--No. 23

IT would probably be difficult to find a man better known to the heads of the mechanical world in Canada, or one more popular among those with whom business or pleasure brings him in contact, than J. P. McNaughton, the general sales manager of the Dominion Iron & Steel Company.

James Percy McNaughton was born May 8th, 1867, at Ottawa, his parents being Malcolm McNaughton and Maria (Ogilvie) McNaughton, both natives of Montreal. He received his education in the public schools of Ottawa and at the Ottawa Collegiate Institute. His initiation into the world of business took place in the year 1885, when he entered the wholesale warehouse of McIntyre, Son & Co., Montreal. He remained with this firm for three years, and then went to Drummond, McCall & Co., Montreal, since when his connection with the steel and iron business has been continuous.

After holding various responsible positions with Drummond, McCall & Co. for nine years, Mr. McNaughton left to form the firm of Lamplough & McNaughton, who

JAMES PERCY McNAUGHTON.

engaged in the metal brokerage business. In 1903 he was approached by the Dominion Iron & Steel Company and accepted a position as their Montreal sales agent. Two years later he received the appointment of General Sales Agent, which important post he still holds.

The Dominion Iron & Steel Company is the largest steel concern in Canada, and employs a small army of men in its various departments. Mr. McNaughton is therefore kept extremely busy, and has no time for hobbies nor yet for political offices. While he has had several very good opportunities of holding high civic positions, he prefers to devote his whole time to the business interests of his firm.

Mr. McNaughton is a member of the Royal Cape Breton Yacht Club; the Engineers' Club, Montreal; and is a life member of the Montreal Amateur Athletic Association.

He was married April 26th, 1911, to Etta May Peirce Peppett, of North Sydney, and has one son, born May 13th, 1912.

THE FAILURES AS WELL AS THE SUCCESSES.

IT is a well established fact that, whether as individuals, as a community or a nation, we not only are prone to, but quite deliberately and systematically cultivate and practise the suppression of our every failure in no matter what sphere or department such may have been our experience. The question has been repeatedly asked—Should engineers publish details of their failures as well as of their successes? and except on the ground of personal susceptibility and its probable effect on their future social and professional standing, there are no other reasons in sight to make the answer to the query other than in the affirmative. Of course, what is applicable to the engineering profession applies with equal force to every craft and calling, and need we point out that failure, as well as success is the legacy of every human, entering as they do into every nook and cranny of our complex being.

Aside, however, from the foregoing, or, as we might dub it, the sentimental feature, there is more or less weakness apparent in this universally practised shrinking from making our failures public, yet it must be admitted that the attitude adopted in screening our failures is not altogether without beneficial results. We, perhaps, glorify success to an undue extent in every walk of life, and, did we otherwise, much of what we now call failure might well merit the higher title. Success and failure are in many cases twin events, neither being at any time far removed from the other; a failure of success and a success from failure being a daily occurrence.

All of our boasted twentieth century advancement, progress, and achievement are the results of success from failure and disappointment, even to the extent of despair, and when we are disposed to mope over the non-accomplishment of some cherished ideal or find the stress of competition bearing hard, it should be remembered that if we cannot rise to success from what to us seems nothing but a wreck, another will, and that, of course, as a result of what our failure has shown him. All of us add our little quota to the general forward movement in affairs individual, social, commercial, business, political, national, and religious, and we need not worry overmuch if sometimes we sow and another reaps.

In the business world, individuals, companies, and corporations are victims of the up and down process which we define as success and failure, and it is well perhaps that life is so constituted. The trouble, however, is that the down process usually appeals to and points the direction in vain for the cure, with the consequence that those affected look to everything and everybody else but themselves for a cause and a culprit of their misfortune.

All manufacturing concerns have not an equal rating in the matter of machine type, quality or quantity output; a condition easily realized because each individual being in or out of their employ has a rating peculiar to himself and consequently bears a comparative relationship to his fellow. Forms and application of products vary in successful adaptation from a variety of causes, avoidable and otherwise, and may in many instances never adequately bring success in their train, but if the latter be possible of achievement, and this be sincerely desired, then, besides the blazoning of the failure abroad, the contributory causes pertaining thereto should be made fully known in addition, so that not only those directly interested, but others whose work lies along kindred lines may either join hands in the remedy or build and operate better than the original craftsman.

Might we suggest to contributors to Canadian Machinery, that records of failure are stepping-stones to success, but the contributory facts must of necessity be full and complete, otherwise when superficial statements are made, the effects are destructive, and may unwittingly be the means of "knocking," or its equivalent—kicking a man when he is down.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Feb. 23, 1914.—No new developments have taken place in business circles, but in most lines trade continues to show an improvement. There is a very fair demand for boiler and tank plates and also for boiler tubes. Prices are very firm and an advance may be looked for shortly. In bar iron and steel, on the other hand, business is not quite so brisk, and no great improvement in the steel situation is looked for until the building trade picks up again.

Disappointment is felt in machine tool circles at the announcement that the Grand Trunk Railway do not at present contemplate rebuilding the shops destroyed by fire recently at Port Huron. Dealers had been hoping that a nice order for new equipment would be placed for these shops. Mussens, Ltd., report having closed an order for the complete machine shop equipment required by Balby, Yerburgh & Hutchison in connection with their contract on Section No. 3 of the new Welland Canal.

The Metal Market.

In the metal market business still remains quiet. There is a small demand for pig iron, but other metals are distinctly dull. Copper is a shade easier than last week, but there is no improvement in the demand and the market is almost at a standstill. Present indications point to continued easy prices for this metal.

The spelter market is also undoubtedly dull, but the large producers are showing no inclination to force business, being mostly well supplied with contracts.

The tin situation shows signs of becoming more settled and there has been some heavy buying by dealers during the past week or two. The price has fallen locally to $42, a drop of $1 from last week, and it is probable that a period of dullness may follow the present activity.

Toronto, Ont., Feb. 24, 1914.—The principal feature to record this week is the annual automobile show held in the Canadian National Exhibition Buildings. The attendance and sales exceeded those of last year, which would seem to indicate that the coming season promises to be a satisfactory one for automobile manufacturers. Not the least interesting feature was the success of the motor truck manufacturers, it being reported that orders for over 100 trucks, heavy and light models, were booked. This is a big advance over last year's show, and indicates the large place which motor trucks are taking in industrial circles. Further reference to the truck feature is made in another section of our columns.

The market generally is quiet, no movements of any moment having been recorded during the week. Prices in structural steel remain firm, and little increase in the volume of business can be expected until building operations become more active. The continued cold weather is to a large extent responsible for the cessation of building operations, and that condition, combined with the financial stringency, directly affects the structural steel market. With moderating weather and advancement of the season business will, no doubt, improve. One firm reports that some nice specifications for reinforcement bars are in sight, and that business with them is pretty fair.

In the smaller lines, such as tool steel and machine shop supplies, business continues quiet, and will remain so until trade generally becomes more active. Reports from Ontario indicate that few large orders are being placed; those secured being principally for immediate requirements.

The machine tool market remains inactive, and no improvement can be reported over last week. One local firm sold a Pratt & Whitney die sinker to the Dominion Stamping Co., Walkerville, who are equipping a plant there for making automobile windshields. They may be requiring more tools later. The C.P.R. have sent out a specification for radial drills for the Angus shops, Montreal.

Municipalities are beginning to consider their requirements for the coming season, and already a few specifications for cast iron pipe have been issued.

The weakness in the metal market reported last week still continues, both tin and lead having suffered a slight drop, the former being quoted at $42 and the latter at $5.30. Other prices remain stationary.

Sir Thomas Skinner has been appointed governor of the Hudson's Bay Co., in succession to the late Lord Strathcona.

Machinists' Ball at St. Thomas, Ont.—The fourth annual ball of St. Thomas Lodge, No. 294, International Association of Machinists, was held in the Engineers' Auditorium, on Monday evening, February 23rd. The committee in charge made every effort and succeeded in making this the social event of the season. Many out-of-town visitors, including the officers of the Grand Lodge, were present. Alfred Dunn's orchestra of twelve pieces rendered the following programme: —"Sailing Down Chesapeake Bay," "Come to the Ball," "Carolina Rag," "Golden Dreams," "Salvation Nell," "When I Fell in Love With You," "Trail of the Lonesome Pine," "Just a Dream of You, Dear," "Get Out and Get Under," "A Thousand Kisses," "Skeleton Rag," "Old Wedding Gown," "Kill That Bear," "You're My Sweetheart," "Big Red Motor," "Charme D'Amour," "Silvery Bells," "I Love You, Dear," "My Hero," "Porissinio," "Isle D'Amour," "A La Militaire," "I'm Falling in Love With Some One." A buffet lunch was provided by Taylor & Bond. The committee in charge were T. W. Stone, chairman; H. A. Vicary, secretary-treasurer; J. H. Gray, J. Lane, C. J. Rowley, A. Buchan, G. Richardson, J. W. S. Boath, L. W. Loney.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Bridgeburg, Ont.—The Grand Trunk Railway are extending their yard system, and will build coal chutes and a sand-drying building.

Regina, Sask.—It is announced that two important industries may locate here. They consist of a flax mill and a hat factory.

Ottawa, Ont.—A deputation representing Montreal financial interests recently waited on Premier Borden, asking for a $15,000,000 bond guarantee for a tunnel under the St. Lawrence.

Guelph, Ont.—The Standard Fitting and Valve Company's building and plant have been sold to a Cleveland firm manufacturing carbon steel products, who are establishing a Canadian branch.

Ottawa, Ont.—The foundry owned by the Alie Brothers, at Maniwaki, was completely destroyed by fire a few days ago. The loss is estimated at about four thousand dollars. There is no insurance.

Sarnia, Ont.—It has been decided to go ahead with the construction of the new coal dock at Point Edward to replace the one recently destroyed by fire. It is probable that the new dock will be built of steel.

Alliston, Ont.—The Dominion Gas Tractor Co. have decided to equip a plant for manufacturing gas traction engines. An existing building will be equipped with the necessary machinery and a foundry built later.

Ottawa, Ont.—Tenders are being called by the National Transcontinental Railway Commissioners for a "shavings and sawdust exhaust system" for the car shops at Transcona, Man. W. J. Press, mechanical engineer, Ottawa.

Galt, Ont.—The Union Metal Manufacturing Co., of Canton, O., are building a one-storey brick factory near the C.P.R. tracks, and will manufacture metal lighting and verandah columns, pressed steel tables and interior metal decorations.

Guelph, Ont.—The last engine in the old power house has been sold to Christie Bros., of Owen Sound. This was the last piece of machinery left of the civic plant, all of it being put out of use by the introduction of Hydro-Electric power.

Kerrobert, Sask.—Another new concern to locate in Kerrobert within the past few days is the Farmers' Machine Co., of Melville. Mr. Helgerson, the manager, is in town, and has made arrangements for the erection of a building 100 x 150 on the Board of Trade property, Railway Avenue West.

Electrical

St. Mary's.—A number of Nissouri farmers have made application to the Hydro-Electric Commission for power and light.

Windsor, Ont.—Niagara power will be here by June. The towers are in place to Chatham and tower foundations are completed.

Ayr, Ont.—The council here instructed the clerk to write the Hydro Commission and notify them that the town was ready to sign the contract for 100 horsepower.

Clinton, Ont.—The town is now using Hydro power and is supplying the Solo Player Piano Co., the Clinton News-Record and Doherty Piano Co., with power.

Strathroy, Ont.—The Hydro-Electric by-law carried here Monday with a sweeping majority of 102. Also the loan to the Canadian Handle Co. carried by a majority of 386.

Winnipeg, Man.—It is announced that the Winnipeg Electric Railway will undertake extensive hydro-electric developments. Plans are being prepared by the J. G. White Corporation, New York.

Woodbridge, Ont.—Woodbridge Council have decided to negotiate with the Hydro Electric Commission for supply of power for the municipality. An agreement was framed giving the current to the village at $38.50 per h.p.

Huntsville, Ont.—At a conference held between the Huntsville Council and members of the Bracebridge Electric Light Commission the question of purchasing power from Bracebridge was discussed, but it was thought that the Bracebridge Commission had no legal authority to sell electric power.

Municipal

Regina, Sask.—The city council propose to spend $170,000 on sewers.

St. Thomas, Ont.—The council are considering the purchase of steel garbage wagons.

Sarnia, Ont.—The council are considering the question of garbage disposal and may purchase an incinerator.

Regina, Sask.—Estimates passed recently by the city council include $10,000 for sewage disposal works.

Edmonton, Alta.—The city council have decided to install a sewage disposal plant. $53,000 has been appropriated for the work.

Toronto, Ont.—The city council contemplate buying four auto fire trucks and have appropriated $24,000 for this purpose.

Kingston, Ont.—The council has decided to buy 28 acres of land at Kingston Junction for manufacturing sites, at a cost of $24,000.

Regina, Sask.—A filter bed will be included in the proposed sewage disposal scheme. $35,000 has been included in the estimates for this work.

Plattsville, Ont.—A Hydro-Electric by-law was recently passed and the village council will require poles, wire, meters, etc. R. McKie, secretary.

Kindersley, Sask.—The town are considering the purchase of a motor-driven pump for a proposed waterworks system. No details available at present.

Gloucester, Ont.—The council for Gloucester township contemplate installing a drainage system. Sidwell & Magwood are the engineers in charge of the scheme.

Ottawa, Ont.—The city council have decided to ask the Provincial Legislature for authority to raise $100,000 for the erection and equipment of a municipal abattoir.

New Liskeard, Ont.—The council have decided to purchase a fire truck and hose. A reservoir will probably be constructed and a water pressure recording gauge purchased.

Calgary, Alta.—The city commissioners have decided upon a comprehensive plan of electric extensions, and will

agreements with the Conley Frog and Switch Co., the Davidson & Smith Co. and the new wagon works.

Saskatoon, Sask.—Tenders will be received until March 10 for the supply of 90 tons of cast iron pipe and specials and nine gate valves. Junius Johnson, city engineer.

Montreal, Que.—The city are calling tenders for automobile fire trucks and other apparatus. Tenders to be in by March 26, 1914. L. N. Senecal, secretary, Board of Commission.

Winnipeg, Man.—Tenders will be received by the chairman, Board of Control, up to March 2 for the supply and delivery of 24,000 feet of 36-in. steel pipe and specials. M. Peterson, secretary.

Peterborough, Ont.—Plans are practically completed for the new sewage disposal system to cost $100,000. They will be submitted to the Provincial Board of Health and if approved of, tenders will be called.

Montreal, Que.—The city engineer has presented a report to the Board of Control recommending the expenditure of $12,000,000 for increased transportation facilities. Two subways, an auto bus system and new surface lines in outlying districts are suggested as being necessary to relieve the present congestion.

Galt, Ont.—A representative of the Great Northern Electric Co. was here, negotiating with the council for the installation of 56 electric fire alarm boxes at a cost of $13,000. The council has decided to install the system and only the details remain to close the deal. The present fire brigade, 13 strong, will be increased to 20. New hose will be bought and the whole department overhauled and better equipped.

Refrigeration

Steveston, B.C.—The Columbia Cold Storage Co., will erect a new cold storage plant this spring.

Windsor, Ont.—The Windsor Ice Storage Co. have awarded a contract to the Canadian Ice Machine Co., Toronto, for refrigerating equipment.

Collingwood, Ont. — The Collingwood Fish & Ice Co. will erect an artificial ice plant and packing warehouse in the spring.

Toronto, Ont.—Permission will be asked from the Legislature by the city for power to spend $45,000 to install a cold storage plant in the new municipal abattoir.

Prince Rupert, B.C.—A site of 240 acres has been secured at Porpoise Harbor by B.C. Fisheries, Ltd., Vancouver, for the erection of an ice and cold storage plant.

Sidney, N.S.—R. Christie, of this city is interested in a company who will establish a cold storage plant here. It is expected that the erection of the buildings will be commenced in the spring.

Vancouver, B.C.—The contract for the foundation of the cold storage warehouse for the Vancouver-Prince Rupert Meat Co., has been awarded to E. J. Ryan, 568 Granville St. Separate tenders have been invited for cold storage equipment.

Medicine Hat, Alta.—Nelson Spencer, M.L.A., has proposed to the city council that he build a cold storage plant as an aid to the campaign to encourage mixed farming in the vicinity and to help the market. He will build the plant on a site selected by the city.

Contracts Awarded

Kingston, Ont.—The Standard Meter Co., of Toronto, was awarded the contract at $1,640 for 265 meters.

Victoria, B.C.—A contract has been let to Angus McDonnell & Co. for the development of the outer harbor. The contract involves over $2,250,000.

Brockville, Ont.—The contract was awarded to the Babcock & Wilcox Co. by the Brockville council for two boilers of 314 horsepower each, fitted with Detroit stokers and boilers to carry 200 lbs. pressure and 125 degrees superheat.

Ottawa, Ont. — The contract was awarded by the Dominion Government to the Manitoba Bridge and Iron Works, Ltd., of Winnipeg, Man., for the manufacture of 15,000 small and 500 large iron posts to be delivered at Edmonton, Alberta.

Winnipeg, Man.—It was finally decided by the city council to give the American Cast Iron Pipe Co, Birmingham, Alabama, the contract for the supply of 1,000 tons of steel pipe, in preference to the Canadian Iron Corpation at Fort William.

Windsor, Ont.—The following subcontracts have been let in connection with the Remington Arms Co. factory. General contractors, Wells & Gray, Manning House Block; metal work and plumbing, Pennington & Brian, 47 Sandwich St. W.; electrical work, Dominion Electric Co., 4 Pitt St. W.

Sydney, N.S. — The contract for the supply of 11,000 feet of cast iron piping has been let by the city council to the Canada Iron Corporation of Londonderry, N.S. The tenders for the supply of the centrifugal pumping plant were left over for the city engineer to examine the estimates and report to a later meeting.

General Industrial

Embrun, Ont.—The Williams Chemical Co., is building an addition to its plant.

New Liskeard, Ont.—Sam Eplett, of Coldwater, is proposing to build a large ice cream factory.

Windsor, Ont.—The Canadian Lamp & Stamping Co., will erect a one-storey addition to their factory.

London, Ont.—A firm of American tobacco manufacturers are negotiating for a site on which to build a factory.

London, Ont.—The London Pressed Brick Co. will probably build a brick plant at Regina, Sask. Edward Wright is manager.

Wiarton, Ont.—The council will be asked to grant a loan to a local company of $20,000 for the purpose of erecting a casket factory.

Lewiston, N.S.—J. Lewis & Son's factory, which was recently destroyed by fire will be rebuilt and equipped with new machinery.

Tillsonburg, Ont.—J. Austin McGlennon, of the Trent Valley Canners Co., Trenton, will probably establish a canning factory here.

Calgary, Alta.—It is reported that a large automobile factory will be built here. The company is reputed to have a capital of $250,000.

Regina, Sask.—The Canadian Equipment & Supply Co., of Calgary, have opened a new warehouse and office here. F. O'Neil is the local manager.

Petrolea, Ont.—The Canadian Oil Refinery Co. will build a factory for making wax, for which equipment will be required. The cost is estimated at $20,000.

Leduc, Alta.—A. Kuhn and J. Albert are contemplating the erection of a flour mill to have a capacity of 75 barrels per day. It will probably be in operation this fall.

Guelph, Ont.—The Guelph Spring and Axle Co. will in the near future put an addition to their plant, and will then be able to find employment for an additional 15 or 20 hands.

Toronto, Ont.—The plant of the James Purviss Mattress Mfg. Co., 2 Esplanade street, was damaged to the extent of $10,000 by fire recently. The loss is partly covered by insurance.

Canadian Agents: Williams & Wilson, Montreal. The A. R. Williams Machinery Co., Toronto

Walkerville, Ont.—The Willys-Overland Car Co., are looking for a site on which to build a factory. It is considered probable that they will locate here.

Vegreville, Alta.—Natural gas fields are being developed here and an effort will be made to induce manufacturers to establish industries.

Sudbury, Ont.—The Ontario and Manitoba Flour Mills have closed down the plant for a few weeks in order to make necessary repairs to the machinery.

Windsor, Ont.—Maul & Biggs, Ltd., are negotiating with the Industrial Committee for a site in the No. 1 factory district, where they will install a plant for manufacturing artificial stone.

Calgary, Alta.—The Mowbray-Berkeley interests, representing a large group of British capitalists, are arranging to sink their first test well near the western boundry of the Sarcee Indian reserve.

Cardston, Alta.—The Chief Canning Co. has been incorporated with a capital of $100,000. A site has been selected and a pea-canning factory will be built. Dr. Weeks, of Calgary, is interested.

Redcliff, Alta.—A knitting factory will be built here. It is estimated that the cost of buildings and machinery will be about $40,000. Dr. Bonnar represents the syndicate who are financing the project.

Toronto, Ont.—The old tannery of Wickett and Craig, at the corner of Cypress Street and Don Esplanade, was damaged to the extent of $1,500 by fire a few days ago.

Welland, Ont.—A charter has been granted the Ontario Tire & Rubber Co., Ltd., of Welland, the capital stock of which is $750,000. It is intended to carry on a co-operative tire manufacturing business here.

Guelph, Ont.—Libby, McNeil & Libby, food products manufacturers, advise that the equipment of their Toronto plant is being moved to Guelph, and that meantime no new machinery is contemplated.

Sarnia, Ont.—The coal hoist at Point Edward Grand Trunk dock, the property of the Northern Navigation Co., caught fire recently and was almost totally destroyed, entailing a loss of something like $40,000.

Sarnia, Ont.—It is understood that the Nye Odorless Crematory Co., of Atlanta, Georgia, is considering the building of a manufacturing plant in this city in the near future. This company is very well known in the States as manufacturers of incinerators.

have purchased a plant for the special manufacture of smallwares which is to be added to the plant here and will furnish employment to a number of hands.

New Westminster, B C.—Eight thousand dollars damage was done at a fire

Beaverton, Ont.—Minorgan & Sons, of the Phoenix Foundry, are preparing to extend their present premises. The firm which broke out in the warehouse of the Milne Produce Co., Hamilton street, in the new wholesale district. The damage was chiefly to machinery and stock. One butter-making machine valued at $1,000 was destroyed.

Calgary, Alta.—A contract has been let at Olds, Alta., for the immediate drilling of eleven wells in the oil fields discovered in that locality. This is believed to be the largest contract for well drilling ever made in Canada at one time. The minimum expediture under the contract will be $150,000.

Petrolea, Ont.—Fire completely destroyed the Petrolea Motor Company's plant a few days ago, and caused the loss of thirty to forty automobiles and motor trucks, which were either stored in the building or in the process of construction. The monetary loss is not known, but will be very heavy.

Smithers, B.C.—Extensive deposits of iron ore of great value in the Copper River district, a few miles west of Smithers, have been reported upon by Mr. John V. Rittenhouse, of New York, a consulting and mining engineer, who has made a thorough examination of the properties of the North Pacific Iron Mines, Ltd.

Winnipeg, Man.—J. R. Colby, managing director of the Canadian Carbonate Co., is completing arrangements for the erection of a plant to manufacture carbonic acid gas in St. Boniface. The building will be erected near the Western Canada Flour Mills, and will be under the management of R. L. Crysler. It will cover 20,000 square feet and at the commencement give employment to about 50 men.

Wood Working

Burlington, Ont.—Fire recently destroyed the planing mill of A. Coates & Sons. Loss $30,000.

Markdale, Ont.—George Watson, of Flesherton, has purchased a site for the erection of a sash and door factory.

Port Arthur, Ont.—The Bertrand-Lockhart Co. has been incorporated with a capital of $75,000. A planing mill will be erected.

Windsor, Ont.—The Windsor Lumber Co. will operate a wholesale and retail lumber business at the south end of Wyandotte street, and will install sufficient machinery to manufacture special work.

Vancouver, B.C.—Fire destroyed the plant of the Westminster Woodworking Co., at Westminster, causing a loss of $75,000. The whole building, which was insured for $40,000, was completely gutted.

Vankleek Hill, Ont.—The sash and door factory and saw mill owned by J. R. McLaurin, jr., was completely destroyed by fire recently. The loss was about $8.000, covered by only $3,000 insurance. The cause of the fire is unknown.

Railways-Bridges

Hamilton, Ont. — George F. Webb is applying to the city for permission to extend his east end incline railway 30 feet lower.

Brantford, Ont.—The citizens of Brantford will be asked to provide $270,000 for the purchase of the street railway from the bondholders.

Deseronto, Ont. — Efforts are being made to secure a bridge to connect Prince Edward County with Hastings County at the old ferry landing near Deseronto.

Fort Frances, Ont.—The C. N. R. will erect a modern coal handling plant and docks at Fort Frances, early next summer, to replace the former dock which was burned.

Arthur, Ont.—The surveying party of the Hydro-Electric Commission has staked out a route for the proposed hydro-electrical railway as far north as Monck.

Hespeler, Ont.—At the regular meeting of Waterloo Township Council, held on Saturday last, it was decided to erect a steel bridge to span the river at Breslau.

Brantford, Ont.—The bondholders of the Grand Valley Railroad last week. recommended that the offer of the city of Brantford for the purchase of the railway be accepted.

Port Coquitlam, B.C.—New plans are now being prepared by the Provincial Government engineers for the proposed $600,000 traffic and highway bridge to be constructed across the Pitt River.

Hamilton, Ont.—The Dominion Power and Transmission Co. announce that an electric railway extension to Galt would

be built, and construction work on a steam plant to develop 88,000 horsepower, and cost $3,500,000, is now under way.

Ottawa, Ont.—A charter has been granted to the Pacific Peace River and Athabasca Railway Co., to construct a railway from Prince Rupert, B.C., to Prince Albert, Sask. D. A. Thomas, of Cardiff, Wales, is interested in the project.

New Westminster, B.C.—Additions to the rolling stock of the B.C. Electric Railway will shortly be made, when ten new cars, being manufactured at Preston, Ont., will arrive in the city. The old cars will be shipped to New Westminster and will be rebuilt.

London, Ont.—The C.P.R. is planning extensions here in the spring which will make London one of the most important points of the system in Ontario. It is understood that five more miles of siding will be put in and the freight sheds greatly extended.

Ottawa, Ont.—An application by the Canadian Pacific Railway to construct a large tunnel in Glacier Park near Roger Pass, has been granted by the Government. The tunnel will be bored through from Beaver Mouth to Ross Creek, mile 74.46 to mile 88.56, a distance of about fourteen miles.

Ottawa, Ont.—In the Commons Railway Committee last week, the C. P. R. was granted a time extension of two years in which to begin work on the Collingwood branch of the Tillsonburg, Lake Erie and Pacific, which now ends at Embro, Ont. The West Ontario Pacific got a similar extension for its proposed line from London to Goderich.

Galt, Ont.—At the Board of Trade meeting on Feb. 11, Dr. Dakin, chairman of the local Hydro-electric Commission, introduced a proposal for the construction of a Hydro radial from Galt to Hamilton. A resolution was passed requesting the town council to get information as to the probable cost from the Ontario Hydro-electric Commission. An effort will be made to interest the other municipalities concerned.

St. Thomas, Ont.—Geo. B. Wood of Toronto, vice-president of the London and Lake Erie Railway and Transportation Co., states that everything is in readiness to proceed with the construction work on the Aylmer extension as soon as the municipalities agree on the amount each is to guarantee of the company's bonds. The radial people are asking for a guarantee of $20,000 per mile.

Transcona, Man.—The law amendments committee last week passed a bill to give power to Transcona to construct, maintain and operate a street railway in the town. A draft clause, added to the bill, giving Winnipeg and Transcona the right to enter into an agreement for the construction of a tram line between the two towns, was not allowed.

Fort William, Ont.—An auxiliary line of street railway, from end to end of the city, will be built, for which the money has been voted and for which debentures will be sold, as soon as the market is favorable. Commencing with the Empire elevator spur, the line will cross Simpson street and follow Pacific Ave., continuing along Dease and North Syndicate to Victoria, thence down Franklin street to the west end.

St. Catharines, Ont.—The reports of City Engineer Near and Mr. Sprague, the Pittsburg bridge expert, were made known at a meeting last week of the city council. The verdict was strongly in favor of the St. Paul street route, connecting the traffic centres of both sides of the canal as the most direct route. A lump sum estimate of the cost was given at $175,000 with the expectation that the G.T.R. will grant $20,000 and the Dominion Government $50,000.

Sarnia, Ont.—A party of Cleveland capitalists are advocating an electric line between Thamesville, in Kent, to Sombra. The proposed road would pass through Euphemia, Dawn, and Sombra Townships, and a small part of Zone Township, north of Thamesville. The promoters want a grant of $50,000 from each of the three Lambton townships directly interested, the amount to be arranged on a sort of assessment plan, based on the proximity of farm property to the right-of-way.

Toronto, Ont.—Seven new bridges to cost over a million dollars were cut out of the estimates of the works and street commissioners last week as follows:—Spadina road, $106,000; North Glen road, $310,000; Sherbourne street, $151,000; Huntley street, $80,000; St. Clair avenue, Moore Park, $335,000; South Glen road, $80,000, and Winchester street, $71,500. The erection of only one was recommended by the committee. This is for Dundas street, and is estimated to cost $148,000.

Quebec, Que. — New plans have been prepared for the Quebec terminals for the National Transcontinental Railway at a saving of over half a million dollars. The estimated cost of the old scheme was $6,406,152.95. That was for a station on the Champlain Market site and subsidiary works. The new scheme will cost $5,847,250. A station will be put on the market site for river traffic, but the station proper, a union passenger depot, will be built on what is known as the Palais site.

Ottawa, Ont.—Among the bills for new railways in Ontario are the following: The Norfolk and Elgin Railway, which proposes to build a line from Simcoe to Port Burwell; the Bruce Peninsula Railway from Wiarton to Tobermore; the Ontario Railway with two branches, one from Port Maitland to Smithville and second from Point Maitland to Port Colborne; the Ontario Lake Front Co., which proposes a line from a point on the C.P.R. between Havelock and Central Ontario Junction southeast to Cobourg, also another line from the same point to Brighton.

C.P.R. Extension Plans.—C.P.R. extension plans last year and this will involve a total expenditure of around eighty-five million dollars, according to authoritative forecasts current. Vice-President Bury has been in Montreal conferring with President Shaughnessy, but neither as yet has handed out an official statement. The large amount quoted, however, is said to be spread over a number of years, and double-tracking and other parts of the programme will be proceeded with conservatively as the need arises. At the present time there are 133 miles of double track under way between Sudbury and Port Arthur on the Lake Superior division, which alone will cost $6,000,000; 178 miles of double track between Brandon and Calgary, to cost $5,000,000; and 139 miles between Revelstoke and Vancouver, to cost $7,000,000.

Marine

Ottawa, Ont.—The Marine Dept. has to install a 450 c.p. revolving light at Goderich harbor in place of the present

Fort William, Ont.—A bulk freighter with a capacity of 125,000 bushels of wheat will be added to the fleet owned locally by Davidson & Smith.

Ottawa, Ont.—The Dominion Government will make a grant of $15,000,000 to the Montreal Harbor Commission for the completion of harbor improvements and terminal facilities.

Tenders

Saskatoon, Sask.—The City Council invites tenders for the furnishing of goods and material for the year ending 31st December, 1914, under the following contracts:—

1.—Electrical supplies: (a) Copper wire and cable. (b) Poles and cross arms. (c) Transformers. (d) Meters. (e) Sundry electrical supplies. 2.—Hardware supplies.—F. E. Harrison, Mayor.

Vancouver, B.C.—Tenders will be received by the undersigned up to Wednesday, March 4, 1914, for the construction of four viaducts over the Great Northern Railway Co.'s tracks on Hastings, Pender, Keefer and Harris streets, in the city of Vancouver. Wm. McQueen, city clerk.

Ottawa, Ont. — Sealed tenders addressed to the undersigned, and endorsed "Tender for Construction of a 15-inch Hydraulic Self-Propelling Steel Suction Dredge," will be received at this office until 4 p.m. on Tuesday, March 3, 1914, for the construction of a 15-inch Hydraulic Self-Propelling Steel Suction Dredge.—R. C. Desrochers, Secretary, Department of Public Works, Ottawa.

Montreal, Que. — Sealed tenders addressed to the Board of Commissioners will be received until Thursday, March 26, for the supply and delivery of the undermentioned apparatus, viz:—(a)—One automobile salvage wagon; (b) — Four automobile tractors; (c) — Two automobile hose wagons; (d)—One 85-ft. aerial ladder, automobile truck; (e)—One automobile fire engine, of a capacity of 1,200 American gallons. Specifications, forms of tender and envelopes, together with all information required, may be obtained at the office of the purchasing and sales agent, City Hall. L. N. Senecal, secretary, Board of Commissioners' office.

Trade Gossip

Sarnia, Ont.—The walls, roof and windows of the new plant of the Perfection Stove Co. are finished. A concrete floor is now being laid.

Galt, Ont.—Galt is to have another iron tool company, in which it is said four practical mechanics are interested, three of them being outsiders. The new concern is now looking for a building.

Midland, Ont.—Work on the new plant of the Midland Malleable Iron Co. has been suspended for a time. Already $20,000 has been spent on the plant. The company has asked the town for the first instalment of its loan.

Herbert Morris Crane & Hoist Co., Toronto, advise us that Herbert Morris, Ltd., England, with whom they are associated, have recently received an order for ten 10-ton hand operated overhead travelling cranes and two electric cranes from the London & Southwestern Railway Co., of England.

Alliston, Ont.—A proposition to build a plant for the manufacture of traction engines has been received by the town from a company, who will require at least four acres of land, a building at

least 60x150 ft., a fixed assessment of $2,000, and free water.

Galt, Ont.—The Union Metal Co., of Canton, Ohio, which will establish its Canadian branch in Galt, manufactures pressed metal goods, the chief output being ornamental standards. Temporary quarters have been secured in the plant of the Galt Stove and Furnace Works. A site of three acres has been secured on which a large plant will be erected.

Montreal, Que.—One of the latest firms to enter the motor truck field is Canadian Halley's Motor, Ltd., of 10 Colborne street, who will control the sales of Halley trucks for the Dominion. A service station will be established at Montreal, where a full stock of trucks and spare parts will be on hand. Mechanics trained in the Glasgow factory will be stationed in Montreal.

Vancouver, B.C.—Kenneth L. Burnet, W. D. Burdis and J. D. Magee, of Vancouver, have applied to the Provincial Government for a lease of three islands in the North Arm of the Fraser river. Mr. Burnet states that he and his associates are acting in the interests of an English syndicate that has $100,000 ready to invest s a nucleus in the establishment of extensive shipbuilding yards.

Transcona, Man.—A contingent of G.T.P. employees arrived last week from Melville, Sask., for the car shops. This is a result of the announcement by the N.T.R. to the effect that the railway could utilize all the shops it was prepared to accept as completed. J. H. Hodgson, master car builder, has considerable work on hand, but the shops will not run to their full capacity until late in the spring.

Improved Hack Saw Blade.—A new hard edge flexible hack saw blade is being put on the market by Simonds Canada Saw Co. of Montreal, Que. The chief feature about this blade is that it will do the cutting work of the regular hard blade, and in addition is so flexible that it can be bent a great many times without breaking, thus eliminating a large percentage of the breakage which confronts users of hack saw blades. The Simonds hard edge flexible blade is made in the standard lengths and numbers of teeth per inch.

Record Manganese Steel Crossing.—A manganese steel crossing of record size has been manufactured by Edgar Allen & Co., Ltd., Sheffield, England, for the Buenos Aires Great Southern Railway. The rails weigh 100 lb. per yd., and the layout comprises eight sets of 18-ft. switches, four sets of 12-ft. switches, two acute, 14 obtuse, and two compounded triple crossings and closure rails, the whole thus including eight turnouts and eight diamonds. The total length is 432 ft. 1¾ in., while the width at one end is 63 ft. 5⁄8in, and the other 64 ft. 3½ in.

The Gramm Motor Truck Co., of Canada, Ltd., Walkerville, Ont., have opened a branch office in the Continental Life Building, Toronto, with Mr. F. H. Galusha, secretary-treasurer of the company, in charge. Mr. J. Del. Warren has been appointed sales manager with headquarters in Toronto. The company has also opened a service station and garage at 162 Cumberland avenue, where trucks for demonstration purposes will always be available for customers. Mechanics from the factory will be stationed there and a complete stock of spare parts will be carried.

Wabana Ore in the United States.—The Dominion Iron and Steel Co. will, we understand, offer about 150,000 tons of its Wabana iron ore in the Eastern market for shipment this year and Naylor & Co., New York, have been appointed selling agents. This is the first time the company has put any of its ore on the market, the Wabana ores heretofore sold in the United States and Germany being those of the Nova Scotia Steel & Coal Co. The two companies are mining the extensive Belle Island deposits which extend some distance under the sea at Conception Bay, and mining by the Nova Scotia Steel and Coal Co. is now carried on at a distance of two miles from shore. The Dominion Iron and Steel Co.'s ore which Naylor & Co. will offer, runs from 49 to 52 per cent. metallic iron, 11.5 to 1. per cent. silica, 0.01 to 0.05 sulphur, 2 to 3 per cent. lime, 0.65 to 0.90 phosphorus, and about

Russian Pig Iron.—At a meeting of the conference to consider the scarcity of pig iron in Russia, it was stated that the estimated requirements during 1914 of the Ministry of Ways and Communications were 1,016,130 tons of rails, fittings, axles, and the like (besides bolts and nuts) for state and private railways and for new lines, and an additional 32,250 tons of rails for town tramways. Apart from official requirements, there would probably be a demand during 1914 for 290,300 tons of girders, 306,450 tons of wire, 403,230 tons of roofing iron, 1,129,000 tons of assorted iron, 244,930 tons of unassorted iron, 435,480 tons of sheet iron, and 96,940 tons of universal iron, making a total of 2,903,200 tons. Of pig iron for casting purposes, 741,930 tons would be required, also 89,645 tons of steel castings. Beyond agreeing that measures must be adopted for reducing the price of the raw material, and discussing the question of petitioning for a reduction of the import duties, no definite conclusions appear to have been reached.

New Incorporations

The Seelye Combination Tool and Axe Co., Ltd., incorporated at Toronto to manufacture woodmen's tools and implements at Sault Ste. Marie, Ont.

The Cedars Construction Co., Ltd., incorporated at Ottawa, with a capital of $50,000 to construct dams, etc., and develop water powers. Incorporators: E. S. McDougall, Francis G. Bush, etc., Montreal.

The Frontenac Mica Co., Ltd., incorporated at Toronto, capital $50,000, to acquire and operate mines and mineral lands at Sydenham, Ont. Incorporators: George A. Grover, James Y. Murdoch, etc., Toronto.

The Western Mica Corporation, Ltd., incorporated at Ottawa, capital $1,100,000, to acquire, and develop mines at Lewisville, N.B. Incorporators: John D. DeWitt, Nutley, N.J., Frederick W. Winter, Moncton, N.B., etc.

The Northern Ontario Pulp & Development Co., Ltd., incorporated at Toronto, capital $150,000, to carry on the business of pulp and paper manufacturers at Toronto. Incorporators: Harold E. Manning, Bert H. L. Symmes, etc., Toronto.

The Central Ice and Cold Storage Co., Ltd., incorporated at Toronto, capital $500,000, to carry on the business of manufacturing artificial ice and distilled water, at Windsor, Ont. Incorporators: Sutherland Cuddy, Victor G. Pinney, etc., Windsor, Ont.

The Canadian Traylor Engineering & Mfg. Co. Ltd., incorporated at Ottawa, capital $50,000, to manufacture, and import all kinds of machines and machinery, at Montreal. Incorporators: Thomas J. Mullen, Harry Grant, etc., Montreal, Que.

The Ontario Tire & Rubber Co., Ltd., incorporated at Toronto, capital $750,000, to carry on business as rubber producers, manufacturers and dealers in rubber goods, at Welland, Ont. Incorporators: Thomas J. Costello, Robert Cooper, etc., Welland.

The Stoness Anglin Gilbert Mica Mining Co., Ltd., incorporated at Toronto, capital $90,000, to acquire and develop mines and mineral lands, at Kingston, Ont. Incorporators: John H. Stoness, Loughborough, Ont., John E. Anglin, Storrington, Ont., etc.

McLauthlin Elevators, Ltd., incorporated at Ottawa, capital $50,000, to carry on the business of manufacturers of all kinds of elevators, lifts, hoists, dumb waiters, friction whips, escalators, traveling staircases, etc., at Montreal, Que. Incorporators: Eratus E. Howard, Jacob DeWitt, etc., Montreal.

Toronto, Ont.—Henry Dreany, miner, is an incorporator of the Victoria Iron Ore Co., Ltd., organized to make finished products of iron, etc., with headquarters in this city.

The Woodstock Concrete Machinery Co., Ltd., incorporated at Toronto, capital $150,000, to manufacture stone and ore crushers, etc., at Woodstock, Ont. Incorporators: Robert G. Bickerton, Adam A. Stewart, etc., Woodstock.

The Canadian Baby Car Co., Ltd., incorporated at Ottawa, capital $300,000, to manufacture cycles, motorcycles, cycle cars, motor baby cars, automobiles, etc., at Montreal, Que. Incorporators: Napoleon Nantel, Joseph A. Myette, etc., Montreal.

The Canadian Blaugas Co., Ltd., incorporated at Ottawa, capital $300,000, to take over and continue the business presently carried on by Blaugas Co. of Canada, Ltd., at Montreal, Que. Incorporators: Frederick H. Markey, William G. Pugsley, etc., Montreal.

The Uxbridge Piano Co., Ltd., incorporated at Toronto, capital $40,000, to manufacture pianos and organs and parts of same, and all other kinds of musical instruments, at Uxbridge, Ont. Incorporators: Frederick B. Edmunds, Joseph Bone, etc., Toronto.

The Chapleau Wagon and Auto, Ltd., incorporated at Ottawa, capital $100,000, to manufacture automobiles, trucks, wagons, carriages, cars, and other vehicles, at Montreal, Que. Incorporators: Frederic H. Chapleau, Joseph Adolphe Dufresne, etc., Montreal.

St. Johns, Que.—A machinery concern under the name of the Saint Johns Machinery and Tools Co., has been incorporated with a capital of $45,000, with head office here, to carry on business as tool manufacturers and general contractors. The provisional directors are O. Bard, E. Patenaude, J. B. Demers, A. N. Deland, and A. Boutheillier, all of Saint Johns, Que.

Some Files

are made to sell—only. That is: they look all right when new; they feel rough to the touch; they even rub some metal off — and you might almost think they were going to be O.K. But when it comes to a question of "how fast" and "how long," they prove sadly disappointing, for they won't last, neither will they cut quickly during their short lives.

These are the sort you want to leave alone, if you value the efficiency of your shop. And, if by mischance you have collected any of these kind, it will pay you to relegate them to the scrap-heap and substitute clean-cutting, long-lasting, crucible steel

Delta Files

thus making sure of the maximum productiveness from your men's energy—which is only another way of saying "Efficiency."

Delta's are made to sell—yes! But they're made for SERVICE first. Everything about them—the steel, the cutting, the tempering, is done with a view to their giving complete satisfaction when in use. Nothing is left undone, nothing is skimped that will add to their useful ability.

That's why you should order a trial consignment from your jobber, or from us to-day. But in doing so, be sure and look for this trade-mark:—

Catalogues

Chain-blocks.—A new pamphlet issued by the Herbert Morris Crane & Hoist Co., Ltd., Toronto, contains some interesting particulars of their spur-gear chain-blocks. The illustrations show various sizes of chain-blocks and the different parts of which they are composed. Tables are included giving the working load and price of the various sizes.

White Trucks for heavy service are illustrated and described fully in a catalogue recently issued by the White Company, Cleveland, O. Three to five-ton trucks are shown with various types of body for many kinds of service, and a specification is given for each model. Copies of this catalogue may be obtained from the company in Cleveland or from the Canadian office, 14 Alexander street, Toronto.

The Northern Engineering Works, Detroit, Mich., have sent us a copy of their catalogue No. 26, dealing with the various Northern cranes. The reading matter contains references to many of the types which the company make and the illustrations show numerous and varied installations of electric and hand-operated traveling cranes, jib cranes, gantry cranes, etc. Copies of this catalogue may be obtained from Detroit or from the Northern Crane Works, Ltd., Walkerville, Ont.

The R. K. LeBlond Machine Tool Co., Cincinnati, O., have sent us a copy of their new catalogue just off the press. This is a well-arranged publication, the illustrations being very clear and the reading matter describing fully the various lathes which the company make. Special reference is made to the single pulley driven headstock which is a distinctive feature of many of the lathes mentioned. Milling machines and tool grinders are also dealt with. A specification is given for each tool and the catalogue concludes with a telegraph code.

Power Transmitting Machinery is the title of Catalogue No. 35 which we have received from the Canadian Bond Hanger and Coupling Co., Alexandria, Ont. This is a new catalogue and contains particulars of a full line of transmission machinery made by the company. Each type of equipment is illustrated and tables are included giving the principal dimensions, price, and code word of each size. One of the features of the catalogue is the "Grundy" flexible insulated coupling, designed for connecting motors to pumps, fans, etc. The catalogue contains an index and tele-

graph code. Copies may be obtained from the manufacturers or from the Dominion Machinery Co., Toronto, their representative.

The DeKalb Ammonia Compressor is the subject of a catalogue sent to us by the Creamery Package Manufacturing Co., Chicago. The principal features embodied in the design of this compressor are illustrated and described in a comprehensive manner.

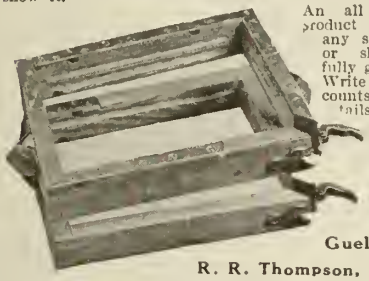
The Pawling & Harnischfeger Co., Milwaukee, Wis., have sent us Bulletin No. 401 devoted to the type "H" crane. The illustrations are very clear and cover the principal features of this product. The reading matter describes the general construction, and also covers the motor and controller features. Copies of this bulletin will be sent to interested readers on request.

The Mesta Machine Co., Pittsburgh, Pa., sent us a copy of Bulletin M, which they have recently issued. The bulletin describes at length the "Mesta" improved pickling machine, designed for pickling all kinds of metal sheets, automobile parts, wire coils, etc. The various types of pickling machines are illustrated and the method of operation treated fully.

The Canadian Westinghouse Co., Ltd., Hamilton, Ont., are distributing a circular No. 1156, dealing with types "S" and "R" direct-current generators. The description of the generators is equivalent to a specification, as each part is dealt with in detail and illustrated. Other illustrations cover steam engine-driven and motor-generator sets. One section of the circular is devoted to field rheostats, which are also illustrated and described in detail.

The Newton Machine Tool Works, Philadelphia, have issued a leaflet describing their type 197-D cold metal sawing machine. Illustrations are given of this machine from various positions, from which the general design can be readily followed. The chief features embodied in the design are dealt with in detail and maximum capacities for various kinds of work given. Copies may be had by writing.

The Canadian General Electric Co., Ltd., Toronto, have issued Bulletin No. A-4064 describing their mill type motors. The constructional features of these motors are illustrated and described at length, each part being treated separately. These motors are specially adapted for working in steel plants and similar service, and are made in various forms, according to the work required of them. The bulletin contains diagrams and tables giving the principal dimensions for each type.



The "GUELPH RIGID" Snap Flask

Will Save You Money Because

It is perfectly RIGID, strong, solid, substantial, exceedingly durable and has no part that can get out of order.

It is made up to the standard, not down to the price—only the very best material is used.

"QUALITY FIRST" is our motto and our goods show it.

An all-Canadian product made in any special size or shape and fully guaranteed. Write for discounts and full details.

The Canadian Westinghouse Co., Ltd., Hamilton, Ont., have sent us their catalogue for 1914 dealing with electric fans. Many types are illustrated and described, and tables are included giving the essential particulars of each type and size.

Westinghouse Portable Meters are dealt with at length in a new circular, 1,104, which the Canadian Westinghouse Co., Ltd., Hamilton, have recently issued. Several types are illustrated and described for both a.c. and d.c. current. Copies will be gladly sent to interested readers.

"Difficult Drilling and Boring Made Easy" is the title of a catalogue recently issued by the Pawling & Harnischfeger Co., Milwaukee, Wis. The title refers to the "P. & H." horizontal drilling and boring machines, which are described and illustrated fully. Several of the illustrations show the machines in operation, and indicate the variety of work that it is possible to handle with these drills.

The Terry Steam Turbine Co., Hartford, Conn., have sent us a copy of Bulletin No. 17, dealing with the "Terry" return-flow steam turbine. The design of this type of condensing turbine is a combination of a multi-velocity stage element for the high pressure end, with a series of multi-pressure stage elements in the low pressure end. The principal features embodied in the design of this turbine are described at length, and the claims for the return-flow principle are dealt with in a comprehensive manner. The illustrations show exterior and interior views of the turbine, while a condensed specification covers the principal constructional features. Copies of this bulletin may be had by writing the company.

Bulletin No. 57 "The Phenix Sight Flow Indicator," recently issued by the Richardson-Phenix Co., of Milwaukee, Wisconsin, illustrates and describes how this unique little device can be inserted in any pipe line carrying a liquid, such as water lines of water cooled transformers and the supply pipes of water jackets of gas engines and air compressors, and how it shows at glance or indicates electrically by lighting a lamp or ringing a bell when the flow of liquid is interrupted. Several recent improvements in the Sight Flow Indicator are also described, showing how it is now possible to adjust the indicator so that it will give an alarm before the liquid stops flowing entirely, that is, when it drops to some predetermined minimum. This improvement has made it especially suitable for use on water-cooled transformers. Copies of the bulletin may be had by addressing the company as above.

Book Reviews

The Department of Mines of the Dominion Government, Ottawa, has published a bulletin No. 257, giving the production of cement, lime, clay products and stone, etc., in Canada during the year 1912. Each material is dealt with successively and tables are included giving the amount and value of products for each province, number of firms engaged in the business and men employed, quantity and value of each material imported and exported.

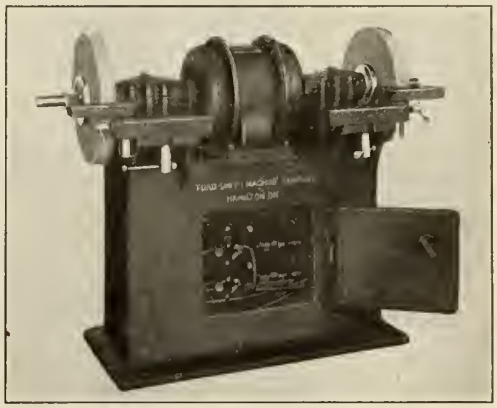
Metal-Mine Accidents is the subject treated in technical paper No. 61, recently published by the Bureau of Mines branch of the Department of the Interior, Washington, D.C. The bulletin has been compiled by Albert H. Fay, and covers accidents which happened during 1912. In addition to the reading matter there are a number of tables included, classifying the various accidents as to the cause and the States where they occurred.

Practical Pattern-Making, by F. W. Barrows, 350 pages, 170 illustrations. Published by the Norman W. Henley Publishing Co., New York. Second edition. Price $2.00. This book, now in its second edition, is a practical treatise on the subject of pattern-making. It is divided into five parts, each sub-divided into chapters. These parts or sections include the introduction, materials and tools, examples of wood patterns, metal patterns, and the last part suggests a practical method for the inventory and valuation of patterns. The progress made in pattern-making is reviewed in the first part. In the second part the selection of suitable lumber and suggestions for bench work are dealt with. Other chapters describe various pattern shop tools and method of working them; fillets, stave and segment work are also covered in this section. Part three explains the method of making wood patterns for various machine and engine parts. Part four deals with metal patterns and describes the construction of globe valve and multiple core boxes. The last part deals with the cost of patterns, pattern records and accounts for cost keeping and inventory purposes. The art of pattern-making being more or less complex, it is difficult to explain the various methods in such a manner that they can be followed in actual practice. The author, however, has made a praiseworthy attempt to provide a useful book for pattern-makers, especially for those learning the trade, and has been successful as far is is possible within the limits prescribed.

Ford-Smith High-Grade Grinders

"Built for Heavy and Continuous Service"

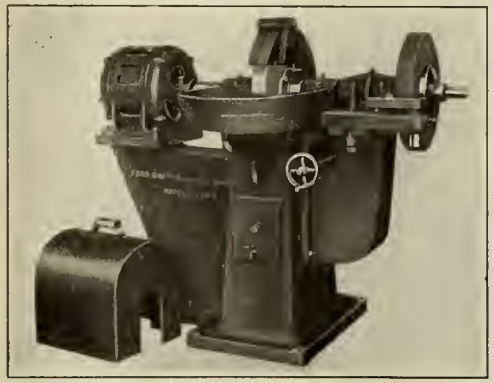
20-in. Floor Grinder



Our Line Comprises:—
Bench Grinders,
Floor Grinders,
Tool Grinders,
Swing Grinders,
Special Grinders,
in all sizes,
6 in. to 36 in. Emery Wheels.

BELT OR MOTOR-DRIVEN.

Steel Taper Safety Flanges. Steel Protection Hoods.



20-in. Floor Grinder, Motor-Driven Mc.

16-in. Water Tool Grinder

16-in. Combination Wet and Dry Motor-Driven Grinder

Convenience is the keynote of our design, combined with liberal and properly distributed weight to eliminate vibration. Materials are bought on their suitability to the purpose intended and the workmanship is "machine tool grade."

Compare our product with the best you ever saw. We substantiate our claims and guarantee satisfaction.

"A well-built heavy Grinder delivers the goods and saves its cost in Emery Wheels."

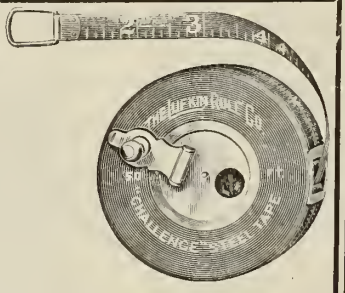
PRACTICAL BOOKS FOR PRACTICAL MEN

These books were written especially for practical self-instruction, by experts whose experience and standing make them authorities.



They are so clear that the beginner can understand them; so thorough that the trained worker can learn from them; so practical that they will give any man a working knowledge of the subjects that they treat, and save him both time and money.

They not only cover the fundamental principles of mechanical science, engineering practice, and business usage, but also present the latest developments and the accepted practice of the most successful men, in those lines.

They give men a practical knowledge of practical things, which enables them to think more accurately and to work more efficiently; and they compose the most helpful, reliable, and comprehensive series of home study books ever put upon the market.

AMERICAN SCHOOL OF CORRESPONDENCE, PUBLISHERS, 58th St. and Drexel Ave. CHICAGO, ILLINOIS.

You Deserve It

Time and again, many of you have seen this ad., and paid no attention to it, forgotten it.

And then, just when your motors are working the hardest, just when you need them the most, they break down. That's logic. The more the strain on a machine, the more likelihood of collapse.

THEN is when you want to **KNOW** that your repairs will be done **quickly, thoroughly** and not treated indifferently as an unavoidable nuisance.

You send your machine to the Manufacturer who is more interested in turning out other new ones.

You get the **Natural Result, Delay.**

What Do You Expect?

Now this time cut off the bottom part of this ad. Paste it up in front of you, or give it to your Superintendent and see that he puts it where he can see it.

Of more importance, act on the suggestion it conveys when next you need Repairs.

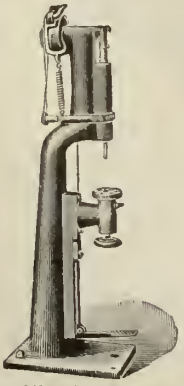
CUT GEARS
THEORETICALLY CORRECT
IN
RAWHIDE OR METAL
ROBERT GARDNER & SON LTD
Nazareth St. ~ MONTREAL



THIS is our 20-ton jack mounted on 15 in. Steel Base, is 22 in. high, rise 11 in., can be detached from base and used in the ordinary way.

Loads of half the rated capacity of the jack can be raised on the foot from within 3 in. of the ground.

For raising or moving buildings, heavy machinery, loaded cars, or anything in the tons to handle, this jack will be found ready, reliable, convenient and quick in operation. Working parts protected, and can be practically run in oil while the outside is always neat and clean.

Manufactured by
Canadian Brake Shoe Co. Ltd., Sherbrooke, Que.
Successors to
The Canada Lifting Jack Co.

Elastic Rotary Blow Riveter

ONE TAKES THE PLACE OF FOUR

One of our Riveting Machines is doing the work of four hand operators and doing it BETTER. The work is uniform; just as good at 6 P.M. as at 8 or 9 A.M.

Figure up the profit at the end of the year. Can't you save as much? Send us samples of your work, and let us help you.

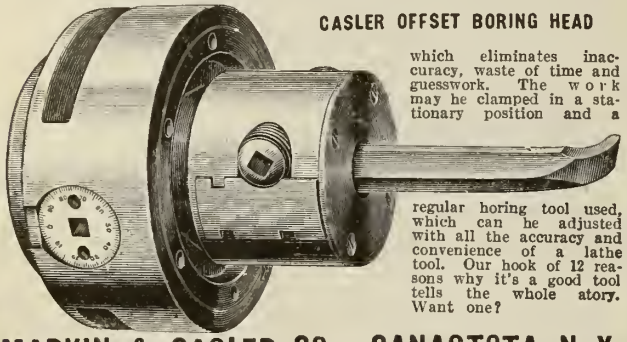
The First Law

of nature is self-preservation. To save yourself is natural. But why need you have conditions in your plant to warrant the carrying out of this law? One of the worst danger factors you have to deal with is the projecting set screw. Why not safeguard your factory by using

Allen Safety Set Screws

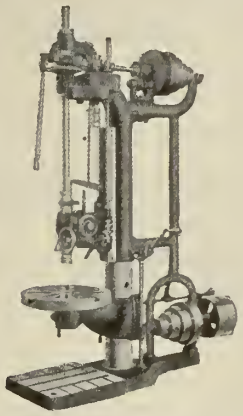
throughout. A small article but a great big trouble saver.



Your dealer carries them, so the next time his salesman calls just say ALLEN to him, and see how he "comes back." Send for circular!

THE ALLEN MFG. CO., Inc., HARTFORD, CONN.

Canadian Factory: St Johns, P. Q., Canada



A NEW WAY OF BORING HOLES WITH THE

CASLER OFFSET BORING HEAD

which eliminates inaccuracy, waste of time and guesswork. The work may be clamped in a stationary position and a regular boring tool used, which can be adjusted with all the accuracy and convenience of a lathe tool. Our book of 12 reasons why it's a good tool tells the whole atory. Want one?

MARVIN & CASLER CO., CANASTOTA, N. Y.

Let This

"Mechanic's Drill"

solve your drilling problems for you. It has gone into the plants of many of our customers and done their drill press work so efficiently that at the first opportunity they've ordered more.

The "Mechanic's" is a straight forward drill press with lots of power to drive high speed drills up to the limit of their endurance. It may be had either with or without Tapping Attachment, and is made in a variety of sizes, both single and multiple spindle.

Three-Lever Control Means Fast Production

One lever opens the chuck, feeds the stock and locks the chuck again. Starting, stopping and changing speeds is accomplished by a second lever, while a slight movement of the third lever changes the feed for turret slide.

Roller Feed handles round, square or hexagonal stock, and feeds any length without adjustment. It is quickly set for any size of bar.

Variable Turret Slide Feed can be changed while machine is running, and will pull any cut within capacity of machine.

Circular free on request.

Economical Drilling

?

Yes: Providing you use a properly made, uniformly tempered drill. "CLEVELAND" Drills can always be depended on.

Circular 30 C—"Down-To-The-Minute-Tool-Making" will interest you.

The CLEVELAND Twist Drill Co.

New York CLEVELAND Chicago

Little Giant

The Unbreakable Tap Wrench

Made in **GALT, Ont.**

Stronger

than the largest tap within its range

Made of **Drop-Forged Steel**—the strongest, **toughest** metal for the constant twisting strain to which a tap and reamer wrench is subjected.

Jaws are of special tool steel; hardened so as not to be distorted by **any** strain that can come upon them; and finely polished.

To adjust, turn one handle.

Made famous by its imitators.

Rivett Bench Lathes

No. 4 Lathe with Slide Rest

Sizes:—Bed	36″
Swing	8″
Chuck capacity	5/8″

The cut shows one of the most popular Rivett Machines, the No. 4 Lathe and Slide Rest with the Eccentric Tool Holder—a Rivett invention.

It is a New Departure of proven value—any Mechanic will quickly recognize the superior practical qualities of this Tool Post.

Let us tell you more about this Lathe and also the other Rivett Machine Tools.

They are accurate, rigid and practical.

WILT

Accuracy

The processes by which Wilt Twist Drills are made—a process which mills a finished drill from the rough stock at ONE CHUCKING—insures not only remarkable accuracy and uniformity, but produces a clean-cut clearance and a groove that is scientifically perfect.

The steels used in Wilt Twist Drills, both high-speed and carbon, are the very best that can be obtained.

Durability

The heat treatment to which Wilt Twist Drills are subjected is done with scientific accuracy by men of long training and experience. A battery of electric furnaces of the latest type insures to drills so treated even the most minute refinements of the heat treatment art. The one-chucking process, backed by this scientific heat treatment, produces a drill perfect in accuracy and remarkable in efficiency and durability. Try them on your hardest job. Write us.

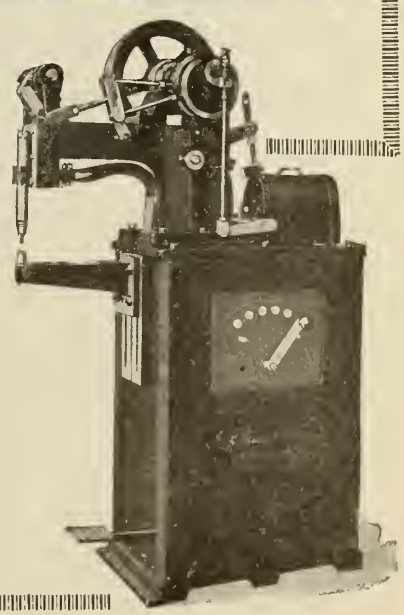
Agnew



Spot and Butt Welding MACHINES

You take no chances when you purchase an Agnew Electric Welder.

They are built intelligently for rapid production and long service.

They are always ready to work and never out of order.

We are experts in the art of electric welding and when you get an Agnew machine you get more than a good machine; you will have the benefit of years of experience in the art of welding.

We assist our customers in working out difficult welding propositions.

Ask for catalog and samples; we build twelve different sizes of machines and make prompt deliveries.

The New Metal Worker Pattern Book

This is the most elaborate and complete work that has ever been brought out for the use of sheet metal pattern cutters. It is printed from new type with a new and improved arrangement, especially convenient for reference and study. Parts of a former edition, entitled The Metal Worker Pattern Book, which have been utilized in its preparation, have been re-written and simplified and later methods embodied. 218 problems are now given, 75 of which are entirely new. A Treatise on Pattern Cutting as applied to all Branches of Sheet Metal Work. By George W. Kittredge. 430 Pages; 744 illustrations; Size, 10 x 13 inches. Cloth bound, Price, $5.00. Sent postpaid only on receipt of price.

The YOST

Solid Jaw and Swivel Bottom Machinist's Vise

MADE IN CANADA.

A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satisfaction. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

Incomparably Good

The National catalog would certainly interest you. Write us, asking for a copy.

National Machinery & Supply Co., Ltd.

HAMILTON - - ONTARIO

This Guarantee Goes With Every Vise: We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia

Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.

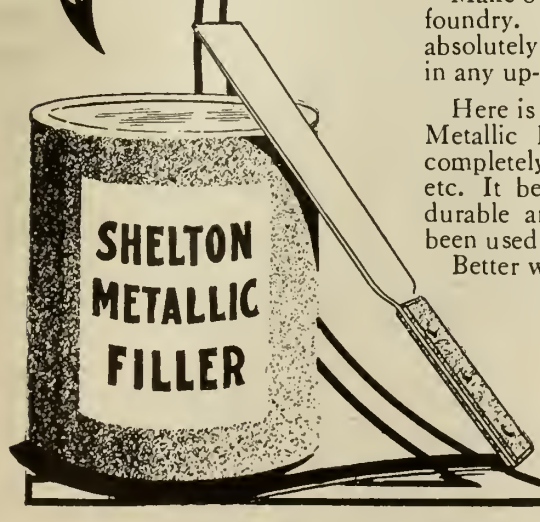
A sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN



Shelton Metallic Filler

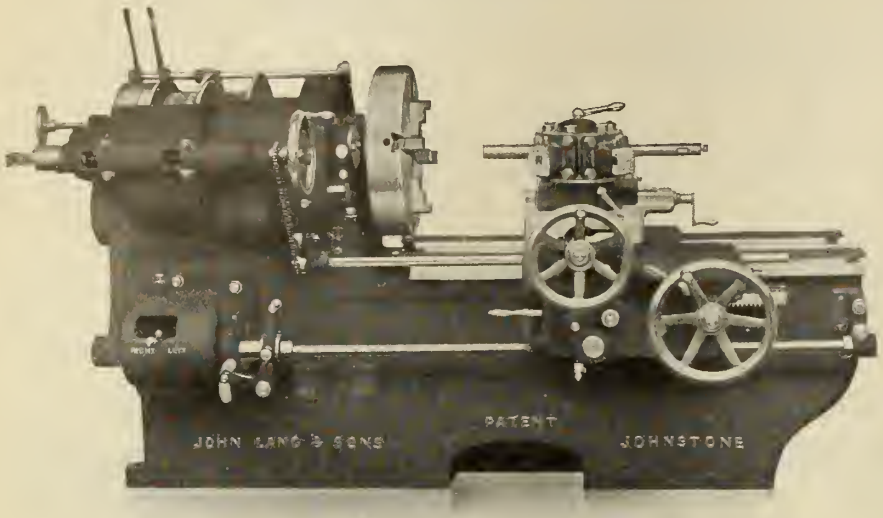
is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years.

Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER



At a slight cost the "bum" casting can be made as good as the ***best---don't throw it on the scrap heap.***

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed. Write us.

CIRCULATES EVERYWHERE IN CANADA

CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

MONTREAL, Eastern Townships Bank Bldg. TORONTO, 143-149 University Ave. WINNIPEG, 34 Royal Bank Bldg. LONDON, ENG., 88 Fleet St., E.C.

Vol. XI | Publication Office: Toronto, March 5, 1914 | No. 10

REPRODUCTION OF SAMPLES cut from Castings machined and BENT COLD, illustrating the SUPERIORITY of "DOMINION" CAST STEEL for machinery parts, with a cost but slightly in excess of grey iron.

REPRESENTATIVE PHYSICAL TEST:

Tensile Strength, 74200

Elastic Limit, 38400

Elongation in 2", 31.2%

Reduction in Area 51.5%

The greater strength and durability and freedom from blow-holes protect you against complaints, and lost sales that are the result of grey, broken iron parts.

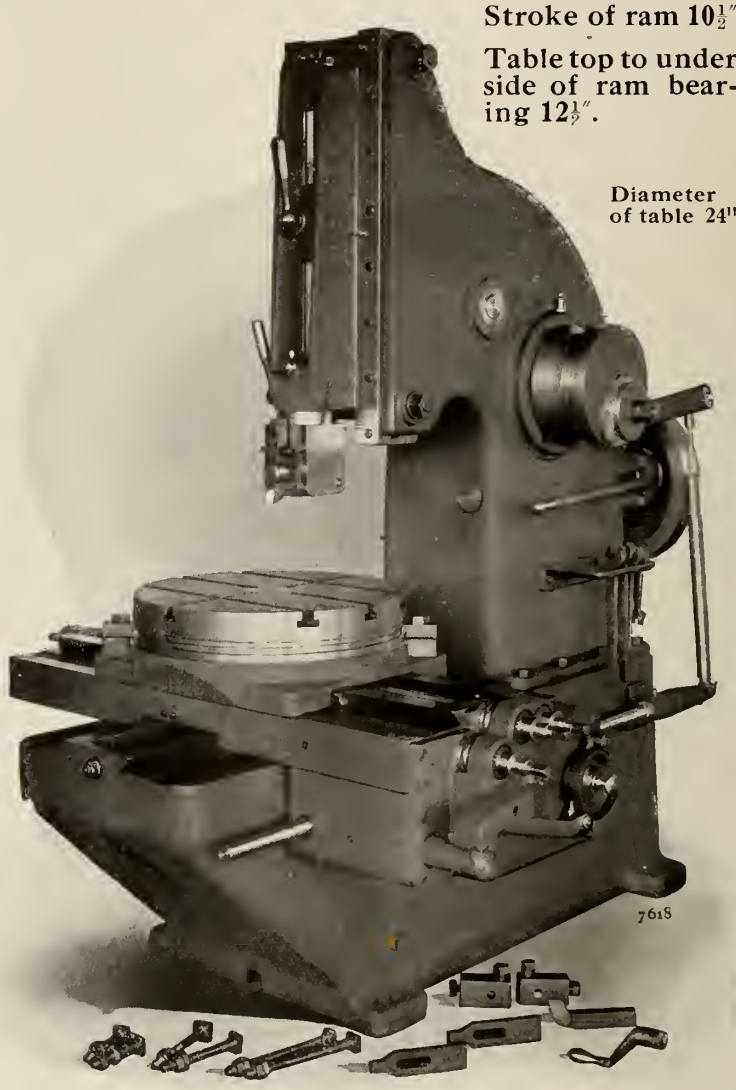
Remember the better your castings the better your product—and the better your business.

Dominion Steel Castings are the product of our **Acid Open-Hearth Furnace**, and are made from a **special** alloy steel mixture. All heats subject to chemical and physical tests.

The Dominion Steel Foundry Co., Ltd.

Capacity 1,200 tons per month

Hamilton, Ont.



Cash Capital, $725,000

Larger Size Vertical Shaper

New Model with 10½" Stroke of Ram

Perhaps you have some work which you realize is not being handled as efficiently as possible because it is too large for the 6 in. Vertical Shaper. For this work we have designed the

New 10" P. & W. Vertical Shaper

Differs from 6" Machine in Some Features

Power Rotary Feed. The 10" Vertical Shaper is provided with power rotary as well as longitudinal and transverse power feeds.

Compact Feed Mechanism. The entire feed mechanism is self-contained in one compact unit on the right side of the saddle. The longitudinal, transverse and rotary power feeds are conveniently engaged, disengaged and reversed from this unit.

Powerful Worm and Wheel Drive.

Power is applied to the ram through a powerful worm and worm-wheel drive.

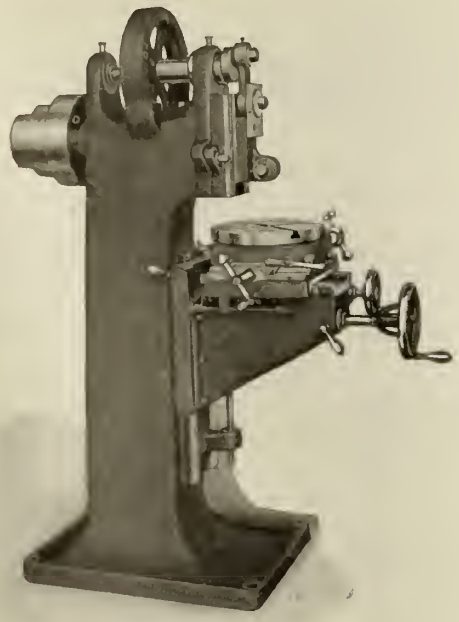
Why the Vertical Shaper Should Appeal to You

In the first place it is a machine of great range and you should never have any difficulty in keeping it busy. It will handle efficiently both slotting machine and horizontal shaper work in addition to work for which its distinctive features make it particularly adapted.

With the angular adjustment of the ram, this machine is in a class by itself on die work, convex, concave and irregular surfaces.

Swiveling ram head enables tool to be set in most convenient position; also various sides of work can be machined at one setting and with much greater accuracy than possible on horizontal shaper.

Although machine is proportioned to give unquestioned stability and provided with ample power for every requirement, it is a precision tool of great accuracy. The cutting stress holds the table and slides together and there is no tendency for the table to yield as on the horizontal shaper.



The entire control is within easy reach and conveniently operated.

Ram may be started and stopped independent of driving motor by means of clutch.

Pratt & Whitney Company, Hartford, Conn., U.S.A.

SALES AGENTS FOR CANADA:

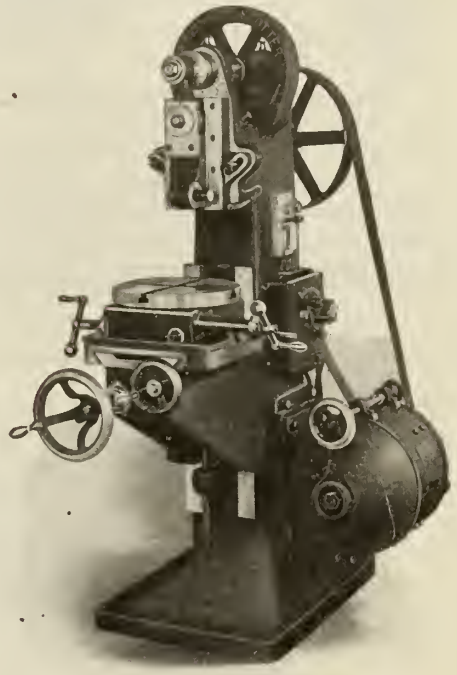
THE CANADIAN FAIRBANKS-MORSE CO., Limited, Montreal, Toronto, Vancouver, Winnipeg, St. John, Calgary

Garvin Die Slotting Machine.
Use Code—Quietus.

GARVIN
Die Slotting Machine

For All Die Work, Key Seating and Small Slotting

This tool is well adapted to all die work, small key seating, both straight and taper; also internal or external gear patterns, where draught is required and all that class of common slotting. The two cross motions and the rotary table provide for following any outline.



The stroke of the machine has been fixed at 3½ inches, which is ample for the class of work for which this machine is intended and affords greater strength than an adjustable pin.

The speed can be changed by means of the cone pulley.

The slide for the ram can be swiveled 5 degrees either way and set by a graduated index, thereby insuring the same draught to every part of the die.

Adjustments—7 x 5½ x 11½ in.

GARVIN Die Slotting Machines are used by many prominent concerns and large manufacturers. Are you in need of a slotting machine?

Die Slotter with Motor Application.

Making Jigs in a Precision Shop. Every Tool a Starrett !

In a shop where the finest jigs and dies are made—where an error of 1-1000″ is large—we found the men using our tools for their measuring and testing. Their only thought was for accuracy, and Starrett tools filled their needs.

Some of these tools belonged to the men — the more expensive ones were furnished from the tool room. But they were all Starretts.

Starrett Combination Set
Starrett Micrometer
Starrett Depth Gage
Starrett Surface Gage
Starrett Test Indicator

Now if you have difficult measuring operations—work that requires extreme accuracy and on which a reputation rests, use Starrett tools. There is a Starrett for every job and you can't go wrong when using one.

Let us send you our big, new, free catalog No. 203 so you can learn what tools you need and how much they cost.

Repeat orders are the best evidence of a superior tool.

"Erie" Double Frame Steam Forging Hammers

are correctly designed and so well built that repeat orders come to us as a matter of course.

Let us point out to you some of the exclusive and superior features of the "ERIE" HAMMERS.

Erie Foundry Company, Erie, Pa.

How do YOU judge a drill?

The only way to truly judge a drill is by the work it will do—the results obtained. "Detroit" Drills cut the most metal with the least re-grinding and they will not prove "soft" at the centre when they do go to the grinder.

"Detroit" Twist Drills

save time on every job. Comparative tests have proved that they will cut from 8 to 30 inches more metal per grinding than their nearest competitor. In their making nothing is left to chance or guess-work—no "rule o' thumb" here.

We make all kinds of small tools and would like to supply your needs. We have the experience, the equipment and the determination to make our services the most satisfactory you have ever known.

Catalog "R" for the asking.
Let a test convince you.

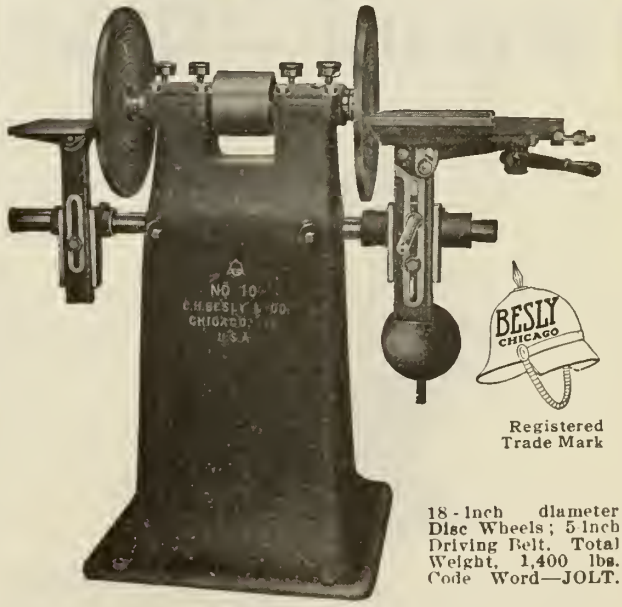
Our No. 18 BUFFER

is a necessity to every machine shop. Constructed from the very best metals and thoroughly up-to-date in every respect.

It is **absolutely guaranteed** to meet with the users' complete approval. This is a **Buffer** that has "**made good**" with other firms. **Why hesitate about giving it a trial?**



Full details and prices on request.

Valley City Machine Works

20 Compau Street, GRAND RAPIDS, MICH.

Selling Agents in Canada: Williams & Wilson, MONTREAL. General Supply Co. of Canada, OTTAWA and TORONTO.

The World's Most Popular DISC GRINDER

Registered Trade Mark

18-Inch diameter Disc Wheels; 5-Inch Driving Belt. Total Weight, 1,400 lbs. Code Word—JOLT.

NO. 10-18.—G. BESLY GRINDER.

For general Fitting and Finishing, and Manufacturing operations, requiring 18-in. diameter disc wheels.

One of the most useful tools known to machine shop practice.

Costs only Six Cents a Day for Interest on Investment. Ask us for Details.

Charles H. Besly & Co.

Chicago, Ill., U.S.A.

Canadian Agents:

Williams & Wilson, Montreal. H. W. Petrie, Ltd., Toronto.

Portable Emery Grinder

Take the Tool to the Work and Save Heavy Handling

We are Inventors of the **Flexible Shaft** For all Purposes

The oldest and largest manufacturers in the world.

CAN FURNISH MOTOR DRIVEN WHEN DESIRED

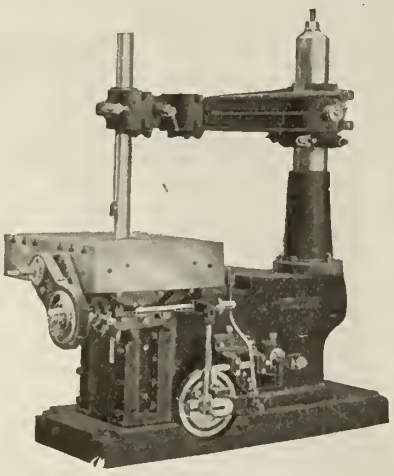
Write Us for Catalogue and Prices.

STOW MFG. CO. BINGHAMTON NEW YORK

Established 1875

General European Agents—Selson Engineering Co., Ltd.
85 Queen Victoria St., LONDON, ENG.

ACCURACY



Just now you may be ordering in smaller quantities, but you want quick deliveries and full value — every Screw and Nut a good one. We can supply your demands by shipping "Galt" products from stock—the quality is assured.

We specialize in Cap and Set Screws.

THE
GALT MACHINE SCREW CO., LIMITED
GALT, CANADA

Keyseater and Slotter

Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

Baker Brothers, Toledo, Ohio.

16 in. Lever POST DRILL

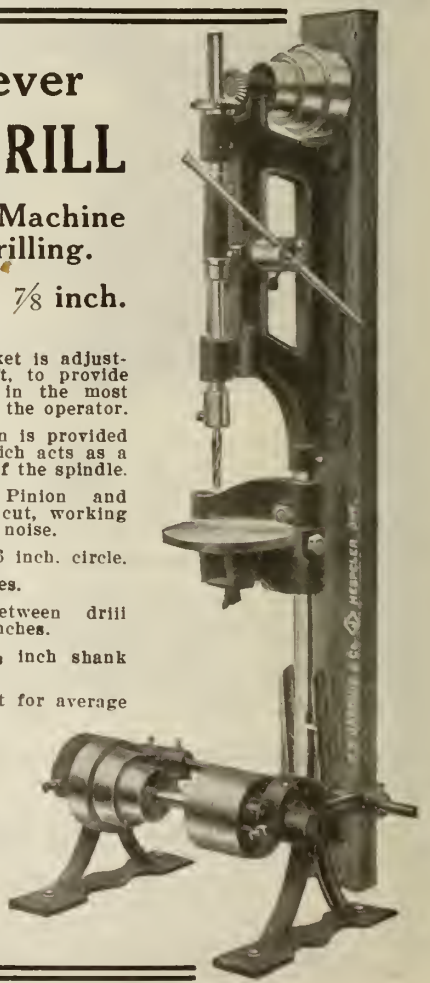
A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.



Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

A. B. Jardine & Co.

Hespeler, Ontario

"We Believe in Others When We Believe in Ourselves"

¶ So long as there is someone, somewhere, who has confidence in my plans, in my individual growth—I shall not fail him. The fact that someone believes in us, perhaps a little child, has made most of us what we are. The individual who predicts our failure—who prophesies our undoing—is not our friend, for the reason that always the **prophet** wishes that his prophecies may be fulfilled.

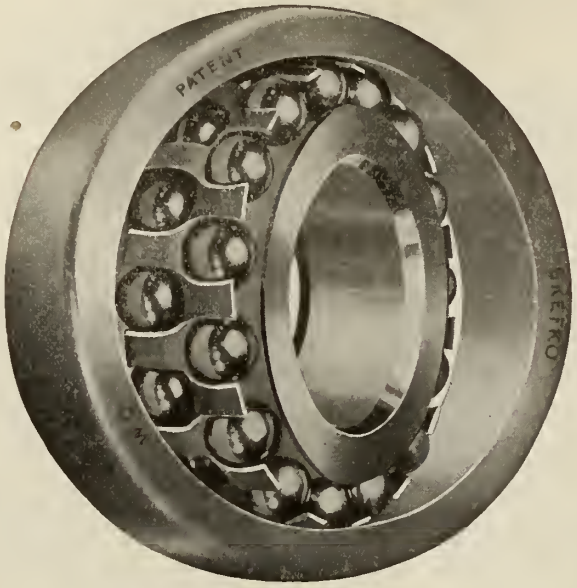
¶ A human life is a precious thing, and like a flower, like a child, or like a plant, requires sympathy and intelligent care, for these two things constitute the **law of culture**. But neither plants, nor children, nor flowers can be forced, coerced or driven.

¶ We require someone who believes that our errors and mistakes do not represent us at our best. But we do not require idlers, self-appointed guardians, to care for our personal interests and to meddle in our private affairs. Peddling our mistakes, faults and failings through business offices, along the streets, and among our friends, will never in any way assist us to meet the big responsibilities of life.

¶ Prophesying, criticizing and meddling do not assist us to grow and unfold. The good in men and women we need in all our ideas and plans in order that we may accomplish bigger things here in this world. But we do not desire to have our lives become the property of meddlers, for these are only "busybodies" who do not fit in with the beautiful things of life, and being out of place in the scheme of things they naturally work hardest where they can do greatest harm.

¶ Self-appointed "trustees" who look after our personal welfare are idlers, traitors and gossipers, all—afflicted with the Meddler's Itch—and like the "walking delegate," their business is to spread discontent and to organize trouble. The information the "gossip" carries can never be used for any purpose but to injure and destroy. The story the idler carries from door to door is not negotiable; it will buy neither books nor railroad tickets, clothes nor food.

¶ Oh, it is so easy to know our friends, they who have faith in us; but they of the "loose tongue" and the "double smile" are our enemies, seeking to undermine our plans, our ideals and our future. It seems to me that most men and women understand and appreciate the good, the true and the beautiful, and I believe that most of us have faith and confidence in ourselves and sympathy and kindness for our neighbors.



¶ Because of these facts in life—these principles which govern as certain as the laws that govern the seasons—**we believe in others when we believe in ourselves.** Each of us requires someone who believes in our plans, someone to say, "This man will build a monument to the Time and the Place in which he lives."

¶ So, if you walk to your office on to-morrow, or to your shop, or to your place in the World of Work, whether it be great or small, whether you are following a plow in the field, or sawing staves in the woods; whether you are behind a counter or behind an enterprise—you are not alone if there is someone who believes in you, who knows that you are not wholly bad.

¶ We need the good in men and women in all our plans in order that we may make the most of ourselves and our opportunities.

Efficiency

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Concerning the Power Feature in Iron Works Operation--I*

By Frank Anslow

In steel making, the actual fuel cost for rolling and finishing, excluding reheating, has been shown to amount to only 5½ per cent. of the total production cost. A similar record is not, however, available, relative to puddling and finishing iron, but even were this equally low, there is believed to be ample scope to effect considerable economy. Towards this the data contained in the accompany article is directed.

WE ARE far beyond the period of high selling prices and low fuel cost, when all the heat generated in the puddling furnaces was allowed to go to waste. Increased cost of fuel and keen competition long since rendered such wastage prohibitive, and the principle of utilizing the waste heat for generating steam in boilers is now accepted. The boilers in the earlier stages were crude in form and badly arranged, but have gradually been superseded and remodeled, until, at the present time, with perhaps occasional exceptions, all furnaces are equipped with boilers of a more or less efficient type.

How much steam can be generated from the waste heat is a matter of controversy, quantities as widely divergent as 2½ lbs. and 8 lbs. of steam per lb. of coal used in the puddling furnaces having been authoritatively stated and equally authoritatively denied. A possible reason for this is that the necessity for knowing the exact quantity—at least in the terms of pounds of steam per pound of coal—has not arisen or been appreciated. The steam generated is used for processes subsequent to the puddling, and so long as there is a sufficiency for this purpose the actual quantity is not material. Considered from this point of view only, all is well if—and so long as—the supply meets the demand; but as soon as the steam generated fails to cope with the requirements the matter assumes importance and some means of increasing or augmenting the supply must be considered. The usual procedure is either to add additional puddling furnaces or alternatively to supplement the steam-raising plant by hand-fired boilers. Assuming a remunerative market for the additional output, there is generally no objection to the former alternative, but the latter represents an additional cost that should not be tolerated unless, or until, everything possible has been done to improve the steam-raising and steam-using conditions.

The Boiler Feature.

Taking these in detail, the first consideration is the boilers. Limitations of space and arrangement and type of furnaces frequently preclude much-needed reform in the boiler plant. The installation of new boilers in such cases is difficult, as, in addition to being costly, it causes inconvenient stoppages. Whenever possible, however, this should be done, the new boilers being of the best type and suitable for high steam pressure. This is being generally recognized and taken advantage of. Tubular boilers, giving greater evaporation, have been adopted, both in connection with puddling and heating furnaces, but their success under arduous conditions, and with bad water has, so far as the author is aware, yet to be proved. Forced draught, which has been successfully applied to puddling furnaces in some works, has the advantage of accelerating the puddling process, allowing a cheaper class of coal to be used, and also increasing the steam-raising capacity of the boilers attached to the furnaces. In passing, the desirability of attention to flues may be emphasized.

Feed Water Feature.

The next point, that of feed water, must be considered from the point of view of temperature, and also of cleanliness and suitability for boiler feed purposes. The impurities in feed water are twofold—namely, those held in suspension which may be removed by settling or filtration, and others of a chemical nature requiring some purifying re-agent for elimination. Many simple arrangements have been devised for improving the circulation of water in boilers, some of which claim not only to do this, but, at the same time to remove impurities in the form of suspended matter from the water.

Water requiring chemical treatment is a more difficult problem, and purifying apparatus should only be decided upon after careful investigation, as apparatus which has entered successfully into one case may be a failure in another. That each 1/16-inch uniform thickness of scale affects the evaporation of a boiler as much as 9 per cent. is in itself convincing evidence that a plant to eliminate the impurity causing the scale will, on the point of efficiency alone, without considering saving in boiler cleaning and upkeep, pay for itself in a very short time. The importance of raising the temperature of feed water to as near boiling point as possible before entering the boilers cannot be overrated. Under certain circumstances economizers may be used to increase the temperature with good results.

Steam Transmission Lines.

Assuming that the steam-raising plant has been improved as far as circumstances will permit, the next link in the chain is the pipe line conveying steam to varous parts of the works. Condensation in the pipe line is a continuous loss, whether the engines are working or standing, and constitutes a serious wastage. A record taken over, say, 12 or 24 hours of coal required to maintain a steady steam pressure with all plant standing will demonstrate the importance of this. The test, with proper supervision, is a practical one, and can easily be carried out wherever a hand-fired boiler is available.

The examination and improvement of the steam-raising and transmitting plant may restore the equilibrium of supply and demand, and even produce a surplus of steam which can be utilized in various ways. Should there, however, still be a shortage of steam, it is necessary to investigate the steam-using plant, consisting of rolling mill engines, steam hammers, and auxiliary engines.

Hammer and Auxiliary Engine Improvements.

Improvements to steam hammers may be in the direction of thorough overhaul and attention to matters of detail with a view to reducing the steam consumption as much as possible and also utilizing the exhaust steam either for feed-water heating or other purposes. The pneumatic hammer has been developed during recent years, and is now applied with successful results to forging and shingling, thus opening out many possibilities.

Improvements in connection with the small auxiliary steam engines driving shears, etc., are difficult. With long lengths of steam pipes and intermittent working, they absorb a considerable portion of the total steam generated, and, lending, themselves, as they do, particularly well to electric driving, they should receive close attention, particularly if an outside source of electric supply is available, which makes them available at all times for immediate work independent of other parts of the plant.

The Mill Engine.

Coming now to the mill engines them-

*From a paper read before the Staffordshire Iron & Steel Institute.

selves. The old beam engine is still employed to a considerable extent in some districts of England, in fact, very few works are without one or more of this class of engine. It is the first object of attack by the would-be reformer and advocate of other forms of power, and many more obvious sources of waste are overlooked in order to root out this—in their opinion—uneconomical and cumbersome plant. This is a mistaken view. Fitted with a condenser, and properly maintained, this engine may still hold its own for economy with many of our modern prime movers. Naturally there are reasons which may be successfully advocated for its displacement; for instance, it may be too small for its work, or too costly in upkeep.

Steam Consumption.

To ascertain the steam consumption of mill engines is a difficult problem—excepting in the rare cases when surface condensing plant is available, in which event the condensed steam may be measured, and thus the exact steam consumption is determined. Indicator cards for this purpose are of little or no assistance. The measurement of steam by steam meters is rapidly becoming practicable. Much useful information may be obtained by their use, and having recently found it necessary to closely investigate their possibilities, the author would, if space permitted, go more fully into the subject.

Having by one or other of these means ascertained the conditions of the engines and made them work as economically as possible, further economies may be attained by superheating the steam and by adding condensing plant where it has not been previously fitted, if circumstances permit. Sometimes it is advantageous to convert simple engines into compound engines, this being especially so when it is possible to increase the steam pressure. Compounding can be arranged either to secure more economical results or to increase the power of the engine, in which case consideration must be given to the strength of other parts of the engine. This question of compounding should be considered with due regard to other matters and possible future requirements.

Summarizing the above, we have the possibility of securing increase in power or saving in fuel to the extent of, say 50 per cent., much or all of which may be taken advantage of, dependent upon the particular conditions, and amounting in a plant producing, say, 40,000 lb. of steam per hour to, say, 600 to 700 h.p., or, say, $10,000 per annum, the amount varying in proportion to the economies it is possible to effect.

So much then for the position as it stands. It is only necessary to add that the conditions may be such as to prevent the reforms reviewed above being carried out to a successful issue, but we will proceed on the assumption that everything practicable has been done to improve the existing steam-raising and steam-using plant, and that there is still a shortage of steam.

Securing Additional Power.

The methods at present available for securing additional power, or utilizing to better advantage the existing steam supply are varied, the whole of which the author has from time to time found it necessary to investigate and apply. They may be summarized under a few main heads:—

Securing Additional Power.

(1)—Use of the live steam in new and economical engines, with condensing plant.

(2)—Use of the live and exhaust steam in turbines for driving the mills direct through gearing.

(3)—Use of the live and exhaust steam in turbines for generating electric power, and driving the mills by means of electric motors.

(4)—Augmentation of existing power by a supply of electricity.

All these schemes and combinations thereof having features specially applicable to the varying conditions encountered render a general comparison impossible, so, as an alternative, it is proposed to describe some typical and representative plants which have been successfully working for a number of years, and to comment upon their main characteristics. It is not necessary to enter into the details of the ordinary type of simple or compound engines referred to under head one. Their application, at least to those conversant with latest practice, is well known. We will, therefore, turn to more recent innovations.

The High-Speed Engine.

The most notable departure within recent years is the application of the high-speed engine to rolling mill work. The advantage of this, for both quick and slow running mills, is at once apparent; gearing may be eliminated and weight and space economized. The first application of the high-speed engine to such work, although not strictly speaking rolling mill work, is closely allied thereto, refers to a plant designed to solve a somewhat complicated problem in connection with the equipment of Rothesay Dock, belonging to the Clyde Navigation Trustees, and was eventually decided upon by their consulting engineer, after close collaboration with the present author.

The generating plant consists of a high-speed triple-expansion engine direct coupled to a generator which is used for generating current for ordinary purposes. By means of a flexible coupling attached to the shaft of this generator, in turn is connected a large fly-wheel and two special generators supplying current to plants which require a large amount of power for short periods. The engine is capable of developing about 450 B.h.p., as a normal load at a speed varying between 375 and 320 r.p.m. The combined output of the three generators is about 1,200 h.p., and the flywheel is designed to equalize these loads and thus ensure a constant load on the engine. The plant has several interesting features, mainly due to the arrangements necessary to cause the requisite drop in speed to permit the flywheel to give out its energy. The application of such a plant, especially where heavy loads have to be equalized, offers many advantages.

Direct Drive by Turbine.

With regard to the use of live and exhaust steam in turbines for direct driving, the introduction of suitable and efficient gearing developed originally for marine work has allowed the steam turbine to be applied to rolling mill work. The mill to which the turbine is coupled, is a plate mill of the three-high type, having rolls 28 in. diameter by 84 in. long. The steam turbine is of the mixed pressure type running at 2,000 r.p.m., which speed is reduced by a double set of gearing to 70 revs., at the mill. The origin of the scheme was to utilize the exhaust steam from existing mills, and, at first, it was proposed to have an electrical scheme, but, for various, and in this case quite cogent, reasons, it was finally decided to adopt the geared turbine drive. The plant has been running for a number of years and, since the preliminary adjustments were made, with quite successful results.

The advantage of this direct utilization of steam either in engines or turbines is an absence of the conversion losses met with in a turbo electric scheme, and also a somewhat less capital expenditure. On the other hand the use of the steam is limited to this particular duty or mill, whereas the scope of the turbo electric arrangement is more extensive. In other words if the plant is simply one unit, then it may be quite satisfactory and economical; if, however, it forms only part of a scheme, other and greater advantage may possibly be obtained by means of electrical generation and transmission.

C. N. Monserratt, chairman of the Quebec Bridge Commission, lectured on the foundation work in connection with the building of the structure before the Toronto branch of the Canadian Society of Civil Engineers at a well-attended meeting of members, on the evening of February 25. The lecture embraced illustrations of various operation features.

The Place and Part of Electricity in Iron Foundries*

By D. B. Rushmore **

A wide range of application of electrically-operated machines, tools and equipment is dealt with in the accompanying article, and while some of the services are generally associated with, at least our large and more modern iron foundry installations, the presentation of the subject as a whole will not fail to arouse a further and possibly keener interest in the continuous progress being recorded in electrically aided production methods.

CONCURRENT with what has taken place in so many other industries, so has electricity entered into every nook and corner of the iron foundry. Lights, cranes, lifting magnets, cupola blowers, exhausters, sand mixers, sand blenders, sand mill screens, elevators, sand sifters conveyors, sand cutters, vibrators or jolt ramming tumblers, sand blast machines, grinders, rope haulage systems, locomotives, high pressure air compressors, etc., all are operated by electricity as a matter of course. Even the heating of metals is being accomplished by electricity. One by one has electricity been adapted as the motive force for these various machines and the present successful state of the art has been the result of much experience sad as well as joyful. It can now be said that every machine of the foundry has been mastered, and, so well are the general requirements of foundries understood that electrical machinery has no trouble whatsoever in keeping pace with new developments in foundry machinery which come up from time to time.

I cannot in a limited space give an exhaustive account of every device on which electricity has been used, but I will try to discuss some of the most important and most recent applications. In passing, I would say that electric motors for use in foundry rooms should have dust proof bearings; all direct current motors should if feasible be totally enclosed on account of their commutators, although alternating current motors have been giving successful operation for a long time with only their bearings enclosed. I would say also that intelligent care of motors is always rewarded. Bearings which are exposed to cutting dust should be inspected and protected and motors not in use may be with profit covered with canvas.

Lighting.

One of the most necessary things around a foundry is light, and artificial lighting is a very hard problem because early in the morning the air is filled with sand and late in the afternoon when no artificial light is needed the air is clearer, therefore, artificial light should be better than daylight.

For general illumination, a very powerful penetrating light is needed. The yellow flaming arc is considered best for this in large rooms where the lamps can be hung 20 feet or over above the floor and the 500-watt Mazda in reflector covered with porcelain is best in small or low rooms and sidebays. Yellow has a peculiar ability to penetrate the fumes and dust.

The lamps should be spaced symmetrically but care should be taken not to make the illumination too even. Many units hung too high cause such an even or well diffused illumination on the working plane that the molders cannot clearly see the lines and curves of molds and patterns. It is, therefore, better where possible to use a few large units than many small ones. However, no general overhead illumination can take care of all requirements, and it is wise to provide plugs at convenient places so that workmen can use small lights for working on the inside of molds.

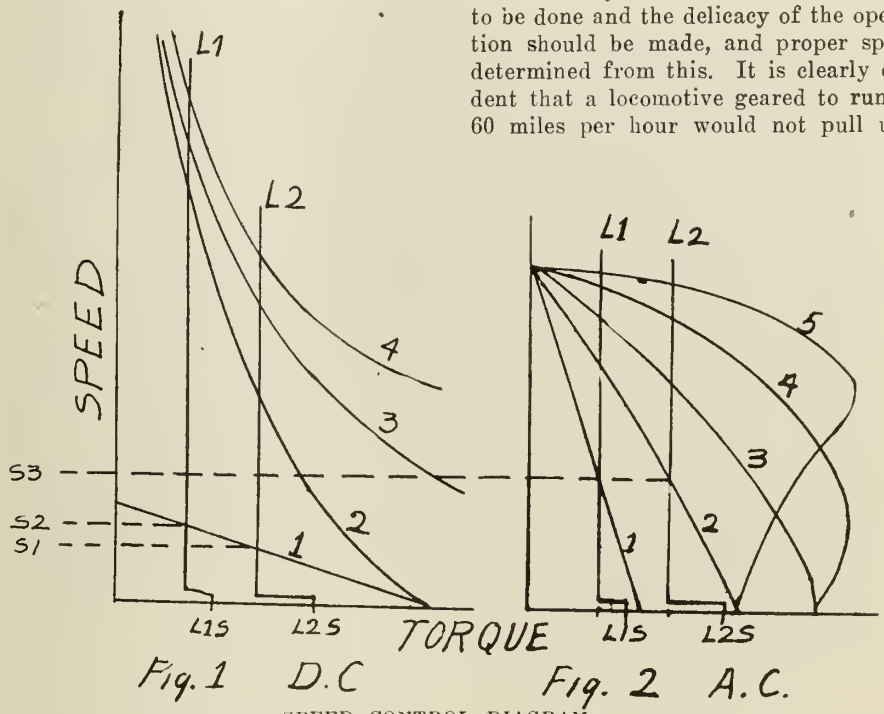

Fig. 1 D.C Fig. 2 A.C.

SPEED CONTROL DIAGRAM.

Cranes.

The most important machine in a foundry is the crane, and for this electricity is well suited. The electric traveling crane has marked a revolution in every plant into which it has entered. No other motive power is even considered, no operation being too delicate and no load too heavy. As the crane is the most important as well as one of the most expensive machines in a foundry, a very careful scientific study of requirements should be made before selection is made. The distribution of heavy and light cranes over the floor should be made to suit the work. A very good solution of this problem is to have large overhead cranes and small side-wall traveling cranes which serve as messengers to the large cranes and which can pass under the latter.

Hook speed is of vital importance. A careful analysis of the amount of work to be done and the delicacy of the operation should be made, and proper speed determined from this. It is clearly evident that a locomotive geared to run at 60 miles per hour would not pull uniformly and slowly enough when drawing a thin pattern, and this speed would be of no advantage in hastening the work. Forty feet per minute is a speed which has met with general favor for 5-ton cranes, and even 60-ft. per minute is in use in a merchant foundry where every conceivable kind of work is done. Fifteen feet per minute is quite common on larger cranes. The only trouble with these higher speeds is that at times speeds of from 1 to 5-ft. per minute must be obtained for drawing patterns, etc. With direct current it is not so hard to obtain this speed, but with alternating current it is very hard unless the crane is geared for a slower speed

*From a recent paper read before the Philadelphia Foundrymen's Association.

**Power and Mining Department, General Electric Co., Schenectady, N.Y.

than the d.c. crane, and even although the most-up-to-date cranes, brakes and controllers be used. I know of a case where a crane is designed to take care of just one kind of work. It was at first thought that 40-ft. per minute hook speed should be used, but on investigation it was shown that 12-ft. per minute would do just as much work in a day and would give ideal control on delicate operations, whereas 40-ft. per minute would have caused a large percentage of lost molds.

As already mentioned d.c. is better as regards creeping speeds than a.c., but if the mechanical load brake be good, and if the proper hook speed be used, there are few cases where it is necessary to go to any extra expense to obtain d.c. if a.c. is the form in which power is generated. Still there are some cases where it is best to use d.c. The General Electric foundry at Erie is entirely a.c.; at Schenectady, it is entirely d.c., and at Pittsfield it is mixed a.c. and d.c. These systems were not chosen on account of foundry requirements at all. The foundry was made to conform to the remainder of the plant.

The accompanying illustration shows the difference between speed control of an a.c. crane, and that of a d.c. crane. In Fig. 1 curves are plotted between torque on motor shaft and speed in r.p.m. Curves 1, 2, 3 and 4 represent speed conditions on points 1, 2, 3 and 4 of a controller. Curve 1 is obtained by connecting resistance in series and in shunt with the armature. Curves 2, 3, 4, are obtained by series resistance. Vertical lines L1 and L2 represent torque required to raise a light and a heavy load respectively. L1s. and L2s. the torque required to break static friction on L1. and L2. It will be seen that the speed where curve 1 crosses L1. and L2. is very nearly the same. Fig. 2 is made in the same manner for a.c., but no such expedient is obtainable for curve 1. It must be obtained by series resistance and is steep instead of flat. Therefore point 1 of the controller will give a creeping speed for light load, but point 2 must be used for heavy load, L2. Even then the speeds are not so slow as point 1. d.c., but within limits just as slow a speed can be obtained by turning the controller "on" and "off" rapidly, and this is done frequently in practice, but requires more care and more skill of the operator.

Where it is strictly required that the creeping speed does not exceed a fixed low percentage of full speed, d.c. is the only solution. How long this percentage must be to make d.c. imperative depends largely on the crane builder and on the ratio of L1s. to L1, and L2s. to L2. If a great deal more torque is required to start a load than to hoist it, the a.c. crane will jump, as it were, much more than the d.c. crane.

In general, a.c. is the best form in which to use power because it is cheaper than d.c. On all other machines except the crane, there is no doubt but that a.c. motors are better than d.c., because nothing about them except their bearings are hurt by foundry dust, whereas d.c. motors must be enclosed on account of their commutators if they are exposed to this dust.

Air Compressor.

Any large continuous running machines like the air compressor may well be driven by a synchronous motor and they should be installed as far away from the dirt as possible. This type of motor can be made to have a leading power factor and thereby compensate for the lagging power factor of the induction motors which are used in other parts of the shop. This feature is especially valuable when central station power is used, or where the motors are installed at a great distance from the power station, because it helps the line regulation and reduces the line losses.

Exhaust Fans and Blowers.

Where exhaust fans are required, it is usually advisable to sectionalize the system and operate relatively small blowers individually by means of direct connected motors in preference to large blowers serving single systems. In this way, the pressure required in different sections of the plant can be readily adjusted by varying the speeds of the driving motors, and, when only one portion of the plant is in operation, the cost of current incurred for this service will be directly proportional to the useful volumes of air exhausted. This method of individual drive is used economically all over the foundry on tumblers, conveyors, grinders, etc.

Centrifugal Compressor.

In the last few years there has been developed the centrifugal compressor. It has followed closely on the heels of the steam turbine and the centrifugal pump. Its operation is practically the reverse of the former and just about like the latter. The growing demand for centrifugal air compressors for cupola service is due to the many advantages inherent in this type. One of the striking features of these compressors is their high efficiency which they are capable of maintaining for years without renewals. This high efficiency is due to the fact that, unlike the ordinary fan or blower, they are capable of recovering in the form of pressure nearly all the velocity energy imparted to the air instead of dissipating it in the form of heat. Owing to the absence of valves and rubbing surfaces there is no possibility of leakage, with the consequent slippage and necessity for renewals; the compressors, therefore, maintain their initial efficiency indefinitely.

Other advantages of the centrifugal compressors are their small size for a given output and their high speed; the latter permitting the use of direct connected high speed drivers. They require no belting or gears with their consequent loss of power, cost of upkeep, space occupied and noise, and therefore are more durable, easier to maintain and operate more efficiently than the old type of cumbersome blowers. For these reasons they appeal strongly to all possible users.

Sets with pressure of about one pound are especially adapted to foundry cupola service on account of the non-pulsating character of the blast. Adjustment of pressure can be obtained by changing the speed of the set by means of the motor field rheostat in the case of direct current drive. This feature is not required in all foundries, although it is considered essential in some. Induction motor driven sets are arranged for constant speed and pressure, and have given entire satisfaction on cupola service. Where reduction of pressure is required, it is accomplished by manipulation of the blast gate. An actual capacity of 400 cu. ft. free air per minute is generally sufficient for each ton of iron melted per hour.

The most important advantage of these compressors is the extreme steadiness of the blast. This causes the continuous descent of the charge in the cupola and the steady melting of iron producing therefore more uniform and satisfactory conditions of the latter. In addition to this advantage, centrifugal compressors recommend themselves strongly for this class of service because of their saving in floor space, cost of foundations, and maintenance expense. The centrifugal type of compressor is well adapted for supplying combustion air to oil or gas fired core ovens, and the compact arrangement of a motor driven compressor ests permits its installation close to the core oven where it occupies but little space and is under the immediate control of the core oven attendant.

Miscellaneous Tools.

Many types of portable tools which are great labor savers are on the market such as sand shifters, sand cutters, etc. A well designed foundry should have connection terminals located conveniently for these machines. An instance of economy obtained by using electricity instead of air is the case of a jarring machine driven by a 10 h.p.

(Continued on page 231.)

Development, Application and Testing of Pneumatic Tools-III*

By H. I. Brackenbury

Pneumatic appliances and apparatus adapted to one or more stages in the manufacture of mechanical and general industrial products determine by their installation in a plant, just to what extent the management of the latter are keeping pace with the progress and development being made in this particular sphere. Applied compressed air claims equal classification with electricity in the revolutionizing of manufacturing methods.

PARTS I. and II. of this article dealt with the historical and practical adaptation features of pneumatic tool equipment. In the present and concluding section, the questions of efficiency, testing, selection for specific service, and the need of, because apparent room for, considerable improvement in various purpose applications, are discussed.

Pneumatic Drill Types.

Pneumatic drills may be divided into two classes. The first class comprises those operated by an engine of the piston and crank-shaft type, the second those which rely upon some form of rotary engine. The second type is attractive on account of its beautiful simplicity, but, so far, the author has not found one capable of giving as large a torque for a given air consumption as those of the first type. The principal difficulty in producing even a reasonably efficient rotary pneumatic engine is the large leakage, which seems almost inevitable.

The best example of the results of this difficulty which has come within the experience of the author was a certain drill which would allow the passage of practically the same volume of air per minute when it was stalled as when it was running. Possibly this was a poor example of its kind, though it must be admitted that, if provided with a sufficient supply of air, it was capable of doing excellent work. The concern that rejoiced in its possession appeared to use it alternately with a pneumatic hammer of another make. The air-compressor was incapable of driving both simultaneously.

In considering the efficiency to be expected from either type, we should remember that the problems to be faced by the manufacturer of an engine as minute as that required for a pneumatic drill are peculiar to the production of any very small device operated by a fluid under pressure. Since the periphery of a body is proportional to its linear dimensions, while its area varies as their square, it follows that the leakage which occurs at a periphery assumes greater and greater relative importance as the size of the part decreases. Thus, suppose we have two pistons, one 1 in. in diameter and the other 2 in. in diameter, each working without piston rings in a cylinder 0.001 in. larger in diameter. Their areas are respectively 0.785 sq. in. and 3.141 sq. in., while the areas of the clearances are 0.003 sq. in. and 0.006 sq. in.—i.e., the clearance of the smaller area is 0.382 per cent. of its area, while that of the larger is only 0.191 per cent. of its area. Further, if the pistons are similar in shape, their lengths will be proportional to their diameter, and any air escaping round the larger piston will have to travel twice the distance that is traversed by the leak round the smaller one. Consequently the waste of air will bear a much greater proportion to that usefully employed in the case of the smaller piston as compared with the larger—in fact, the ratio will be probably more than four times as great.

We see, then, that as far as leakage is concerned, we must not expect as good results from a small engine as from a large one, and, in fact, it is found that leakage is the principal bugbear of the designer of pneumatic tools.

Available Energy in Compressed Air.

Compressed air, as is well known, contains, or may contain, available energy in three forms—viz., kinetic energy due to the velocity of its flow; internal energy, which it can give up on expansion; and the energy due to its pressure and volume, which it can transmit to a piston without expanding. The third type of energy is comparable with that transmitted by the water in an hydraulic pressure main. In most tools as designed at present, this third form of energy is the principal source of power. The purchaser has demanded the maximum possible torque, combined with a minimum size and weight, to gain which all considerations of ideal efficiency have been sacrificed. This has prevented the employment to any large extent of the expansive energy of the working fluid. However, it is possible that another difficulty, now to be considered, has hindered the development of a more efficient thermo dynamic cycle.

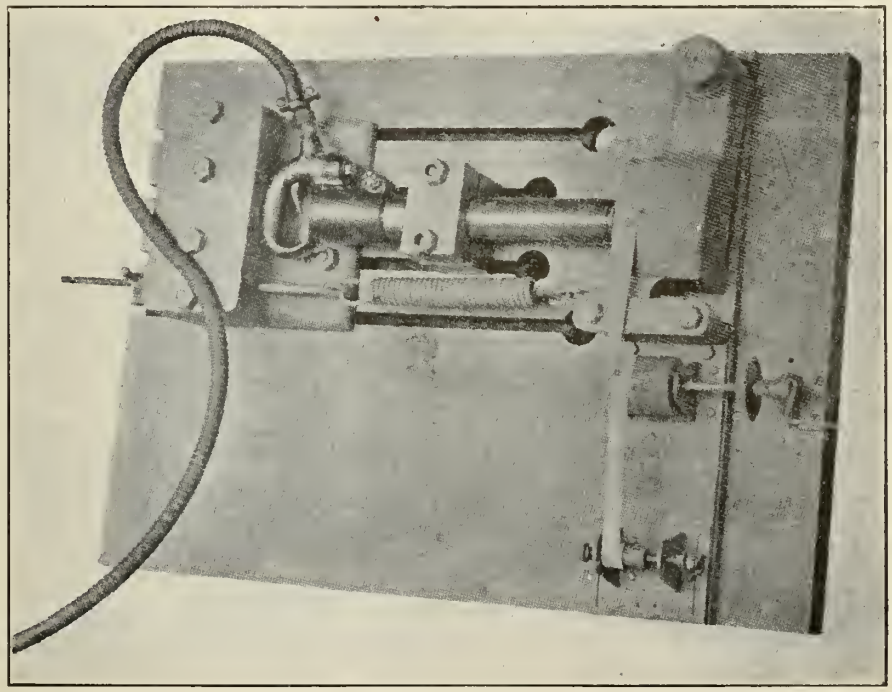

FIG. 14. APPARATUS FOR TESTING PNEUMATIC HAMMERS.

The exhaust outlet of a drill, working during cold weather, is frequently coated with hoar-frost, and cases are not very rare of some types of drills actually freezing up. In testing a drill in Russia, it was found that the exhaust playing on the inlet pipes had cooled it to such an extent that the pipe was blocked by a cylinder of ice, the moisture in the incoming air having, evidently, been condensed and frozen. This is not due, as is often thought, to the lowering of

*From a paper read recently before the Coventry Engineering Society.

the temperature of the air during adiabatic expansion in the cylinders. The expansion ratio is never sufficient to produce such an effect; in fact, there is seldom any expansion at all.

The cause of the trouble is that the air escaping through the exhaust port expands rapidly and gathers velocity up to an enormous figure. Now the kinetic energy, which the air then possesses, due to its high speed, is produced at the expense of the internal energy, which it previously contained when under pressure. Consequently, when the exhaust air is rushing along its way to the atmosphere, its internal energy must be much less than when it was in the cylinder. It follows that its temperature must drop. This, of course, is perfectly well known to the most elementary student of thermodynamics, but it may be worth while to follow the application of the theory to this particular case. If the exhaust air could be brought to rest by causing its kinetic energy to be degraded into heat by means of friction, then its temperature would again rise until it was very nearly equal to what it had been in the cylinder of the drill, the slight difference being, of course, known as the Joule-Thomson effect. The difficulty would probably be to bring this about without producing a back pressure on the piston.

The exhaust of the pneumatic drill may cause the designer other difficulties besides freezing up. Many drills, as already stated, work with practically no expansion. It follows that, the moment the exhaust-port is uncovered, the cylinder must clear itself as quickly as possible of its contents, but the air in escaping expands, so that, in order to avoid all back pressure on the return stroke, the area of the exhaust port would have to be enormous.

If we remember that during the working stroke of a petrol-engine, the gases are expanding and losing heat to the walls of the cylinder, and yet the exhaust-valve has to be designed with a quick lift, and a diameter about one-third of that of the cylinder, we shall realize the difficulties in the case of the pneumatic drill. Unfortunately, the minute size of the latter—apart from other difficulties—renders it almost hopeless to try to take indicator diagrams, so that we cannot be sure exactly as to what goes on in the cylinder. However, it seems highly probable that in most types the back pressure increases very rapidly with increase of speed of running. It should be worth while to try to make a drill with much larger exhaust-valves than are at present used, provided with a high gear ratio, so that the engine, which would be smaller than usual, would run at a higher speed without increasing the speed of the drill. Possibly this would lead to smaller proportional leakage losses, since in a given design these should be nearly constant, while the useful air-consumption should be approximately proportional to the speed.

Thermodynamic Efficiency.

Some of the difficulties inherent to the design of pneumatic tools have already been considered, but no reference has been made to the possible thermodynamic efficiency of these machines. This depends, of course, upon the cycle adopted for their operation. Now it must be distinctly understood that, however much importance we may attach to efficiency in the case of these particular machines, the primary consideration is the attainment of large power for small weight and size. We are therefore prohibited from employing a high expansion ratio, if, indeed, it be worth while to expand the air at all. Further, the rapid lowering of the temperature of the air on expansion would limit this ratio, apart from other considerations. Obviously the possible thermodynamic efficiency is largely decreased by this limitation. Moreover, the proportion of the total energy contained in the air which is available for useful work decreases with increase in the air pressure. The whole of the theory of this subject is perfectly well known already, and can be found in any standard book.

Testing Pneumatic Drills.

The measurement of the brake horse-power of a pneumatic drill offers no particular difficulty if great accuracy be not required. For commercial purposes a prony brake is quite satisfactory. If, however, it be desired to investigate comparatively small changes of brake horse-power, a number of difficulties have to be surmounted. Two forms of brake have been tried. The first consisted of a hollow copper jacket resting on a sheave, which was driven by the drill. The axle of the sheave on one side ran in a single "Skefko" ball-bearing, while the other end was turned to a Morse taper to fit into the drill-chuck. The back centre of the drill abutted on a support carried on an old lathe shifting-head. The whole arrangement was fitted to a discarded lathe-bed. Arrangements were made to keep a stream of cold water flowing continuously through the copper jacket. The latter was lined with lead, so as to bear evenly on the sheave. To one end of this copper jacket there was attached a heavy weight resting on a spring-balance, while a lighter weight attached to the other end was immersed in a vessel of oil, which damped down the oscillations until they did not exceed about ¼ lb. on the spring balance. Of course the lighter weight was corrected for the up-thrust of the oil.

This arrangement was only fairly satisfactory. It was adopted originally in an endeavor to keep the coefficient of friction constant. However, in spite of the water-cooling of the brake, the temperature of the sheave rose slightly, and the load varied a little during a run. Greater difficulty was caused by the wear of the brake.

The apparatus at present under trial is shown in Fig. 13. The brake used with it consists of a fine-quality cotton webbing, and the sheave has been made of larger diameter so as to minimize the rise of temperature. Both with this and the former brake elaborate precautions must be taken to prevent oil or water reaching the surface of the sheave, even contact with the hand altering the coefficient of friction. it is intended to substitute ball-bearings for the present plain bearings, and to make better arrangements for taking up the stretch of the belt. Probably, also, it will be necessary to introduce some spring control on the brake, though the running is much more stable than might be expected. The curves shown in Fig. 10 were obtained with the earlier apparatus. They show somewhat roughly, the general effect on the brake horse-power of a certain drill, of variations in air pressure and of rate of running. It will be easily understood that it is not always possible to devote as much time as one would like to this class of work, and the author regrets that he cannot exhibit more comparative results of brake horse-power tests. For such work it is of a first importance to secure an absolutely steady pressure of air, which is by no means easy, and then the drill must be run until the bearings are at a steady temperature, which requires some time. The curves in Fig. 10 show that over the speed range under investigation, the horse-power developed by the drill increases more slowly than the revolutions. This speed range only was considered, because it corresponded to the actual rate at which the drill would be run in practice.

The most surprising thing about testing drills is the accuracy attainable in the penetration test. If the same man always be employed in feeding the drill through the plate, and precautions be taken to keep all other factors constant, the time of drilling can certainly be found to within two or three seconds per minute. This has been repeatedly proved by submitting drills for test with secretly-altered reference numbers. An accuracy of five per cent. is quite as much as can be expected in most commercial testings of brake horse-power, since this involves reading the revolutions per minute, and the net load on the brake, each correctly to within 2½ per cent. In consequence of this, most

tachometers are not sufficiently accurate for exact work,, and the speeds should always be obtained by means of a revolution counter.

The practical testing of pneumatic drills is difficult, but the testing of pneumatic hammers for power is even more so. Fig. 14 shows an apparatus used by the author for counting the number of blows per minute. Theoretically it should also give the power of each blow, but so many corrections have to be introduced in order to obtain this that the result is not very reliable. About six or seven years ago a highly-trained mathematician undertook this task, and produced a result. Unfortunately this proved to be altogether too excellent, for it appeared that the energy given out by one blow of the piston exceeded that due to the full pressure of the air acting upon it for the full length of the stroke. The author does not propose therefore to give the somewhat lengthy calculations involved. However, the apparatus is of use in testing pneumatic hammers, as will be seen from the curves Fig. 15.

It consists of a massive cast iron bed provided with I-grooves so that a heavy block may be bolted to it in any desired position. Against this block is placed the handle of the hammer to be tested, resting in a formed recess lined with leather to prevent marking the polished surface of the handle. The snap of the hammer abuts against a heavy block, which can swing about a vertical pivot fixed to the bed. This swinging block is controlled by a spring, which can be adjusted by means of a screwed bolt passing through the fixed abutment. To the swinging block is fixed a light steel arm carrying a stumpy pencil, the point of which rests on a strip of paper which can be reeled by hand off one drum on to another. As the instrument is only required to give the oscillation produced, there is no need to employ a uniform drive for winding the paper. The hammer can be reversed in its support, so as to show the vibrations of the handle. It will be noticed that the effect of a leaky-valve is at once recorded in the smaller number of blows delivered by the hammer in a given time.

Three of the curves refer to hammer of the same bore, but of different lengths of stroke. The same handle was employed with each in obtaining these results. It will be seen that as the length of hammer increases the number of strokes per minute decreases. The momentum of the blow, however, must be roughly proportional to the length of stroke. This is not shown on the curves because the spring tension is different in the three cases.

The work required to be done by the light pistons used in some of the best-known chipping-hammers requires material capable of withstanding vibration and shock to an exceptional degree. As an example, a piston weighing 8 oz. now does considerably more work than a piston weighing 14 oz. of an older design. It will therefore be apparent that where no difficulty exists in finding suitable material for the latter, much care must be exercised for the material selected for the former. Each piston should be tested by the Brinnell ball test; but before selecting any new form of material, further tests are required. An ordinary test for the smaller pistons is 60,000 blows from a heavy riveting-hammer; for a special test 500,000 blows or more are used and the piston must show no signs of setting up or fracture.

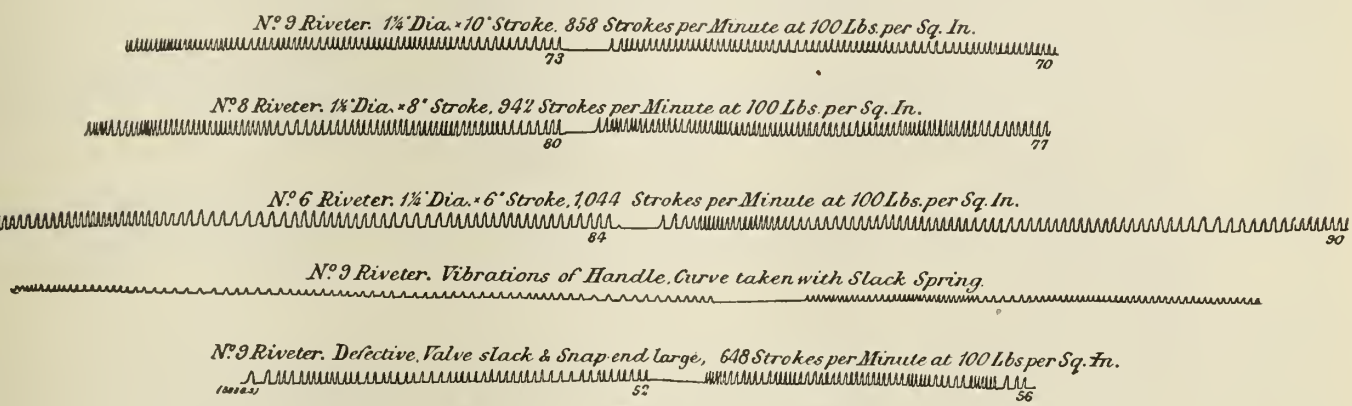

FIG. 15. VARIATIONS OF PNEUMATIC HAMMERS—EACH RUN OF 5 SECONDS DURATION.

Conclusions.

Finally, although the production of a perfect pneumatic hammer appears to be more difficult than the production of a perfect pneumatic drilling machine, the author believes that the designs of hammers have reached a point near finality than the designs of drilling-machines. From the preceding observations on the points of efficiencies in the drilling-machines it will be gathered that there is still room for considerable improvements in this direction. There can, however, be no doubt that the reliability of these machines has been immensely improved within the last few years, as the material for each part is now chosen with the most careful analyses of the duties it has to perform, and nothing is left to chance.

ELECTRICITY IN IRON FOUNDRIES.

(Continued from page 228.)

motor. This machine costs about one-fifth as much for power as an air-operated machine of equal capacity.

While any one would expect electricity to be adaptable for power in working metals, it does not seem so likely that it could be used for heat; yet with the ever increasing cost of coal and oil, electricity is beginning to compete with these fuels for the actual heating of metals. There is no means of prophesying how far this will go. At present it is limited or rather refined or special operations where the convenience and cleanliness of electric heat are valuable or where the ease and accuracy of controlling electric heat make it valuable. I believe that a lot of work has been done in using electricity to melt and refine meats, but this application is one over which I shall have to pass as I have no special knowledge on the subject, and I suggest it as an interesting field for those interested to investigate.

Electricity is, however, used for hardening and tempering steel tools. In the hardening furnace there is a bath of barium chloride through which current is passed, and which can be regulated accurately to any temperature as high as 1400 degs. C. Alternating current is required, preferably at 60 cycles. This current is transformed and controlled by a special transformer. The current passes through the bath and keeps it at a uniform temperature thus giving best results on the tools which are to be hardened. The oil tempering bath is merely a pot of oil kept warm by electrically heated resistance units. Both of these devices have proven commercially successful, and I believe show us that many more fields can be entered.

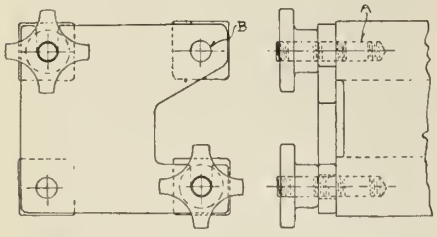
METHODS OF LOCKING JIG COVERS IN PLACE.

By F. Scriber.

WHEN making jigs for interchangeable manufacture it as often as not happens that the best construction for same is to make them in two parts,

FIGS. 1 AND 2. EYEBOLTS AS APPLIED TO LARGE JIG COVER.

namely the body of the jig in which is placed the work, the necessary screws, clamp or bushings that might be required and a cover which may also



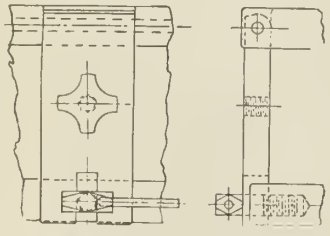


Fig 4

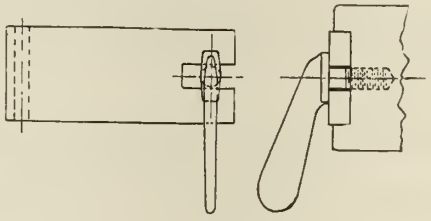
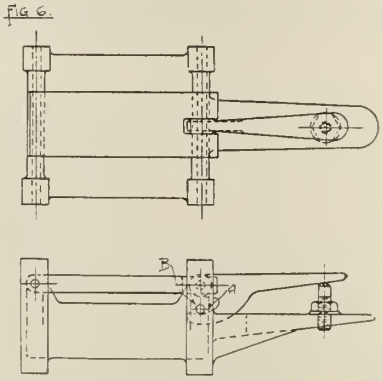
FIGS. 3 AND 4. METHOD OF LOCKING COVER WITH QUARTER-TURN SCREW.

carry screws for clamping and bushings. This cover must be so arranged that it can easily be removed or swung out of the way to permit of the work being removed. The construction should be as simple as possible provided it be rigid and quick operating; this latter depending largely on the number of pieces to be drilled. In the accompanying illustrations it is the purpose to show some of the methods in use for holding or locking these covers in place, and also to give table of proportions which have been found to be good practice for the locking screws and the hand knobs.

Perhaps one of the simplest covers is that shown by Fig. 1 which some might call a clamp, as it is generally used for clamping the work in the jig. It consists of a plate (A) that swings on a stud (B) and is cut out at the opposite end to slip under another stud (C), then, by tightening the screw (D) down,





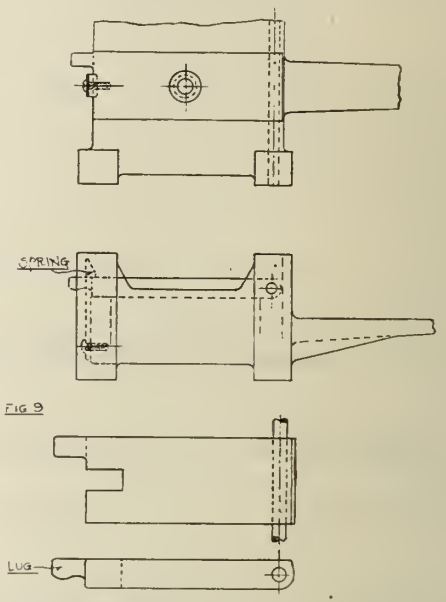


Fig 6.

FIGS. 5 AND 6. METHOD OF CLAMPING WITH CAM LATCH.

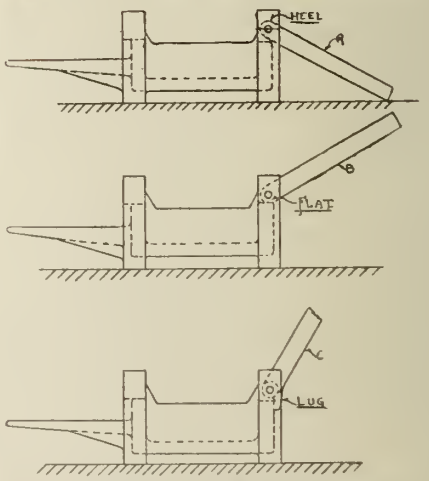
on the work in the jig, it clamps same. To remove the work we loosen the clamping screw and swing the cover to one side.

Another cover of common design is shown by Fig. 2. This is mostly used on large jigs where the distance between studs would be too great to permit the use of the cover in Fig. 1, or where, owing to there being projections on the cover, it would be impossible to swing it to one side. The construction consists of two dowels (A), which are driven into the base of the jig and are allowed to stand above the top of the latter about ¼ inch. The cover is dropped over these dowels, thus being accurately located in place. For clamping the cover on the jig, two swinging bolts (B) with hand knobs (C) are swung into the slots (D) and tightened down on the cover. The reason for using swing bolts on this jig is merely for speed in manipulation as it would be necessary

FIGS. 7 AND 9. COVER PROVIDED WITH GRIPPING LUG FOR HANDLING.

to back the hand knobs off the screws if the bolts could not swing out of the way to let the cover lift straight up off the dowels.

When the cover can be moved to one



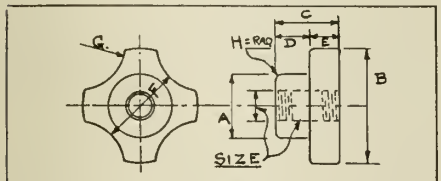


FIG. 8. METHOD OF MAKING HEEL ON COVERS TO PREVENT THEM STRIKING DRILL TABLE.

side on large jigs, it is quite often made as shown by Fig. 3. Plain studs (A), are used with hand knobs for holding them, while the dowels (B) are made to stand above the top of the jig only

1/8 inch. By backing the hand knobs off the screws that much the cover may be lifted off the dowels and moved to one side from under the knobs and off the jig. These last two methods can be used when bushings are carried in the cover, as they are very accurate, although, should there be no desire to do so, the dowels in the cover may be dispensed with. In connection with these covers is shown a table of sizes for the hand knobs used, these being cast to shape and polished.

The remaining forms of covers shown are of the swinging type; all being swung on a pin at one side and bound at the opposite end by various means, of which that shown by Fig. 4 is the most common. A quarter turn locking screw made from bar stock, has a rectangular head, with a pin in the short side which is an aid to turn the screw as required. In use, this screw is made to bind the cover in place when set cross-ways as shown, while a quarter turn brings the head of the screw in line with the slot in the cover, thus permitting the latter to be swung out of the way while removing the work.

Another style of quarter turn screw

SEMI STEEL CASTINGS.

SIZE	5/16-18	3/8-16	1/2-13	9/16-12	5/8-11	3/4-10
A	11/16	7/8	1 1/16	1 3/16	1 1/4	1 1/2
B	1 1/4	1 5/8	2 1/8	2 3/8	2 3/4	3
C	11/16	7/8	1	1 1/16	1 1/4	1 1/4

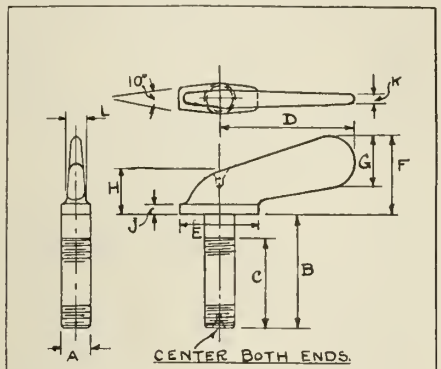
E	5/16	3/8	3/8	7/16	1/2	1/2
F	7/8	1	1 1/16	1 1/2	1 1/2	1 3/4
G	1/2	9/16	5/8	3/4	7/8	1
H	1/16	3/32	3/32	1/8	1/8	1/8



HAND SCREW KNOBS

and one often used by firms who make a large number of jigs is shown by Fig. 5. It is used in the same manner as the previous one, but being required in quantities, is drop-forged.

A good form of lock in general use is of the cam lever type and very quick operating. It differs considerably from the others, the cam latch being pinned to the cover in the manner shown and swinging with same, while for clamping, the slot (A) hooks under a pin (B) in the body of the jig, and as the slot is eccentric, the latch effectively locks the cover in place.

The spring catch shown by Fig. 7 is an example of good practice on jigs of light construction, being simply a spring of the shape shown which hooks over the top of the cover to hold it in place and is sprung off the cover when it is to be swung out of the way to remove the work.

When making jig covers of the swinging type, there are two points which besides the method of locking, it is always best to provide for. The first

A	B	C	D	E	F	G	H
5/16-18	1 1/4	1	1 1/2	3/4	7/8	33/64	7/16

.180	1/8	9/32
.200	9/64	5/16

QUARTER TURN LOCK SCREWS

of these is that some means should be provided to prevent the jig cover from swinging too far over and striking the table of the drill press as shown at (A) Fig. 8. Here the heel of the swinging cover is rounded off and therefore permits the cover to swing into the position shown. Were the heel of this cover made like (B) or had it a lug on like (C), Fig 8, the cover would catch on the jig in the manner shown and this be prevented from striking the table of the drill press and damaging it. Again some means must be provided whereby the free end of the cover can be taken hold off and swung back, and unless there are screws or some other projection on the cover which can be taken hold of for this purpose, it is a good plan to provide a lug on the end of the cover as shown by Fig. 9.

The jig covers illustrated in this article show points in construction that are well to have in mind when making up these tools. While they embrace the general run of these covers, they are often adapted in such varying manners that the principles of construction can hardly be recognized.

The John Inglis Co., Toronto, recently shipped to Victoria, B.C., three submarine bells for service in British Columbia waters. The bells, which are the first of their kind to be employed there, were built to the designs and requirements of the Department of Marine and Fisheries, Ottawa.

TENSION ON CYLINDER COVER STUDS.

By J. H. Rodgers.

IN replying to A. E. W. on his solution to the problem of the Tension on Cylinder Cover Studs, I do not wish to enter into any heated argument in support of my solution, but wish to call his attention and also that of others to what, I believe, to be an error in his view of the question. By closer examination of the article in the February 5th issue of **Canadian Machinery** the tension of 1,005 lbs., under correction by A. E. W. will, I think, be found correct.

A. E. W. contends that, after the studs have been elongated 1-1000 of an inch, due to the initial tightening of the nut, an extra weight of 800 lbs. placed on the cover will put no additional stress on the studs, but if a weight of 2,000 lbs. is placed on the cover the studs will be elongated a further 1-1000 of an inch. Surely there has been some mistake in calculation, for why is it, that there is an elongation of 1-1000 of an inch between a weight of 800 lbs. and one of 2,000 lbs., and yet there is no elongation between 0 and 800 lbs?

C. N. E. ASSOCIATION ANNUAL MEETING.

MANY improvements are to be made at Canada's big fair grounds in the near future. At the annual meeting of the Canadian National Exhibition Association a few days ago, Mr. J. G. Kent, the retiring president, announced that the directors hoped to add very shortly a judging arena that will make the live stock department the superior of anything on the continent.

He stated that another Government building was one of the requirements of the near future, that plans were under consideration for a more uniform method of housing the manufacturers' exhibits, that a new Machinery Hall was absolutely necessary, that the board hopes it will have been provided in another year or two and that it is proposed to provide a new building for dogs and cats. Referring to the educational exhibits he declared that the time had arrived when they should be placed in a separate building. It was also proposed to devote the horticultural building exclusively to horticulturists.

Mr. Kent said the directors were aiming for an increase of 250,000 in the attendance this year, which means that they would like over 1,250,000 people to see the exhibition. The financial statement was the best in the history of the organization, showing a total revenue of $459,238 and net profits of over $100,000.

NOVA SCOTIA STEEL AND COAL ANNUAL REPORT.

THE annual report of the Nova Scotia Steel & Coal Co. for the year 1913, which was issued a few days ago is in every respect gratifying, and indicates that, in spite of one or two disabilities under which the industry labors, the management is alive and progressive, and is capable of realizing to the fullest extent the content and output of its properties on a remunerative basis.

The earnings of the company, after allowing for depreciation, etc., amounted to $1,255,954, so that, after the bond and debenture interest and preferred dividends were paid, the sum remaining was $668,419, and deducting $368,000 for common dividends, there was left a balance of $308,419. After writing off directors' remuneration, reserve fund for depreciation, sinking fund, plant improvement and insurance, which amounted to a total of $233,132, the balance of $75,287 added to profit and loss account, which now stands at $527,887.

Comparative Output Statement.

	1912 tons	1913 tons
Coal mined	841,528	813,877
Coke made	85,334	104,497
Limestone Dolomite ..	66,315	79,329
Pig-iron made	68,784	80,742
O.H. steel ingots made	77,940	86,912
Steel billets rolled ...	71,284	79,865
Total shipments finished, steel forgings, etc.	77,037	76,963

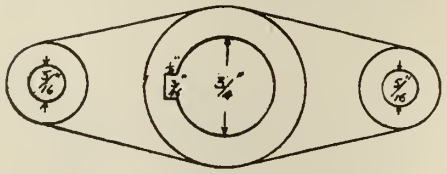
The figures as to pig iron and steel are in tons of 2,000 lbs.

DRAUGHTSMEN AND FOUNDRY WORK.*



By F. W. Hubble.

IN considering this subject it is found that the average draughtsman takes such a small amount of interest in foundry work that it becomes necessary to consider the point of view that a draughtsman should take rather than the one he does. Quite a number of draughtsmen do not consider the foundry at all, or perhaps only consider it when a bad casting has been turned out; and then perhaps it is only for the purpose of recrimination. From the remarks which are sometimes made, one is induced to conclude that a casting with a high finish and correct to 1/100 in. all over is the ideal thing from the drawing-office point of view. This is, of course, quite impossible in practice, but what should be demanded is a clean, sound casting correctly shaped and within reasonable limits of the drawing sizes. It is impossible to closely define "reasonable limits," as each job must be judged on its own merits.

*From a paper read before the London branch of the British Foundrymen's Association.

Knowledge of Most Meagre Kind.

In the endeavor to cut down pattern-shop and foundry expenses, many people

A CASTING TROUBLE.

overlook the essentials of the matter, and particularly the faults that originate in the drawing-office. The lack of foundry knowledge on the part of the average draughtsman is really appalling. It has been many times proved that a draughtsman who has had a good machine-shop and fitting-shop experience is the man who makes the fewest errors in drawing from the point of view of machining and as a natural result it has become quite usual for head draughtsmen to insist on his assistants having a shop training. But, in no sense of the word can this apply to the foundry practice. Why such an important branch should be overlooked it is difficult to say, but the fact remains; and until it is altered, bad castings will also remain. The remedy is as open as that for overcoming machine and fitting-shops troubles. Why not apply the same treatment in the case of the foundry?

The writer can see no reason why the young draughtsman should not spend, say, one or two years, at least, on the foundry floor. Here he would meet the most common of the moulder's difficulties. As this experience, however, although good in itself, is not enough, it is necessary in order to get expert opinion first-hand to keep in touch with the foundryman, and to invite his criticism of the drawing office designs of castings. In the drawing office big alterations can be made by simply altering a line or so, and at the cost of minutes only, but the case is very different when both the pattern and perhaps the castings too have been made. Alterations then become a matter of days and perhaps weeks, in addition to the waste of time and material.

Unnecessary Casting Troubles.

Mention may now be made of some difficulties with castings which are unwarrantably incurred. The writer experienced one, with the casting shown by the sketch. The pattern was arranged for the keyway, the two 5/16-in. holes, and the ¾-in. hole to be cored out. The holes and keyway were, of course, to be machined. Here the pattern-maker had put up the cost of the pattern at least 50 per cent. and the moulding cost another 20 per cent. From the machine-shop point of view, the extra labor spent in coring the holes and keyway was valueless, as it was quite impossible to turn out this casting clean in the cores, they being filled, in fact, with a hard mixture of sand and metal, to the great detriment of the drills and slotting tools. Instead of assisting the job, this feature of the design only put up the cost.

Machining Allowances.

Another point is that with regard to machining allowances. On this point many managers will hold out against us. If machining allowances are too small, time is wasted in sharpening tools. With the more expensive metals, such as brass, gun-metal, phosphor-bronze, etc., there is a strong tendency to cut down machining allowances, with the object of saving that amount of metal on each casting, but too often to get this slight saving in weight of metal, first the pattern-maker is given extra trouble with his patterns, because shapes have to be made which in the ordinary way would be machined out of the plain shape; and next the cost of machining goes up because the sand takes the edge off the tool, which must not go deep enough to escape it. Accordingly, the money saved by cutting down the weight is more than lost in the machine or pattern shop, with the net result that the actual cost of the finished article is raised instead of reduced. Again, the number of bad castings will also go up, because there is not enough allowance to take up any variation caused by the slight differences in the position of the cores.

In conclusion, the writer would advocate a better feeling between the shops and the drawing office, with a view to keeping down ultimate costs. If the drawing office won't give this extra time to their designs, then there must inevitably be wasted a lot of time in the pattern shop and the foundry, and unless the patternshop is allowed to be fairly liberal with machining allowances, much valuable time will be lost in the machine shop.

Concrete Hardening Material. — A concrete hardening material now being introduced in the United States contains 95 per cent. iron dust, which is mixed with cement for finishing the surface of concrete floors. From 15 lbs. to 25 lbs. of the material is mixed with 100 lbs. of the cement while dry, and one part of this mixture to two parts of sand makes the slurry for the top coat, which varies from ½ in. to 1 in. in thickness. It is said to make a hard and durable floor, which is waterproof and not slippery. The hardening material is used also to make new concrete adhere to old concrete in repair work.

Arithmetic for the Machinist and Workshop Operative

By J. H. Rogers

Doubtless some of the elementary work in the first few articles of this series may appear more or less superfluous, but it must be remembered that numerous simple rules and formulae appear from time to time in Technical Journals, which are discarded and dubbed impractical by many operators for the simple reason that the elementals are either unknown or have been forgotten. The purpose of this course will have been achieved if the above tendency is even in part combatted.

IN our February 19 issue the introductory details of the arithmetic course were featured, and progress was noted in the instructional work up to and including multiplication of fractions.

Division of Fractions.

Invert the divisor and proceed as in multiplication.

Example:—Divide 2-16 by $\frac{3}{8}$. Inverting the divisor and multiplying, we have

$$\frac{9\times8}{16\ 3}=\frac{3}{2}=1\tfrac{1}{2}$$

Again, $\frac{3}{4}\times5$

$$\frac{\qquad\qquad}{\qquad\qquad}=\frac{15}{64}$$

$$\frac{3\times5\times64}{4\ 1\ 15}=\frac{16}{1}=16$$

In this case, the product of $\frac{3}{4}\times5$ is to be divided by 15-64.

Examples of this kind may seem to be wandering from the subject of shop work, but as future problems and formulae will require similar solutions, a paragraph here will be of some help when these subjects are met with.

Decimals.

With the exception of the fractions usually met with on the mechanics' steel rule, that is, quarters, eighths, sixteenths, thirty-seconds, etc., the use—and abuse—of common fractions are becoming extinct in the mechanical trades. The use of decimals has become more general, due to the micrometer and other precision tools of accurate measurement. Decimals are tenth fractions; that is, the decimal, or part of a unit, if expressed as a common fraction would have for its denominator ten or a multiple of ten—as 10, 100, 1,000, etc.

In using decimals, the denominator is understood by the number of places represented in the decimal. To express a part of a whole number decimally, a period (.) called the decimal point, is placed directly after the unit figure, and what would be the numerator of a common fraction is placed to the right of the decimal point. The first figure to the right of the decimal point represents tenths; the second hundredths; the third thousandths, etc.; similar to a whole number but reading from right to left. Care must be taken when reading or expressing the value of a decimal that the fractional term (ths.) is used.

When ciphers appear in a decimal, their location has much to do with the value of the expression. Thus, expressing ½ as a decimal, we have .5; but .05 would be 5-100 or 1-20. The value of the decimal is taken from the position of the figures in relation to the decimal point, and not from the figures alone. Chart 4.

Addition of Decimals.

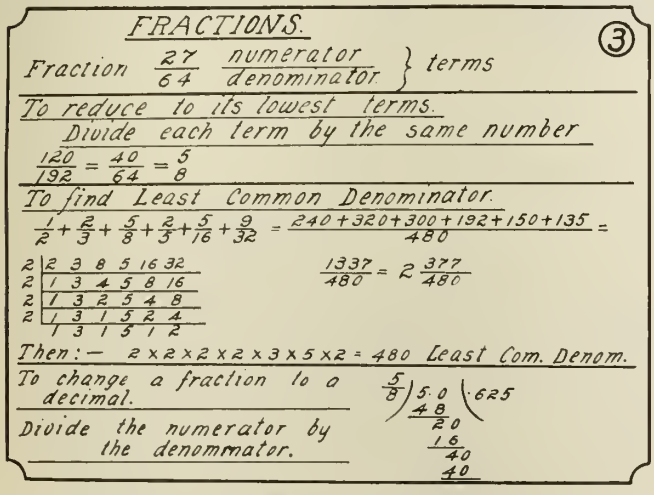
Place the numbers to be added so that the decimal points are directly over each other, and add as in whole numbers. The decimal point in the sum will be directly under the others.

Subtraction of Decimals.

Proceed as in ordinary subtraction, keeping one decimal point directly above the other.

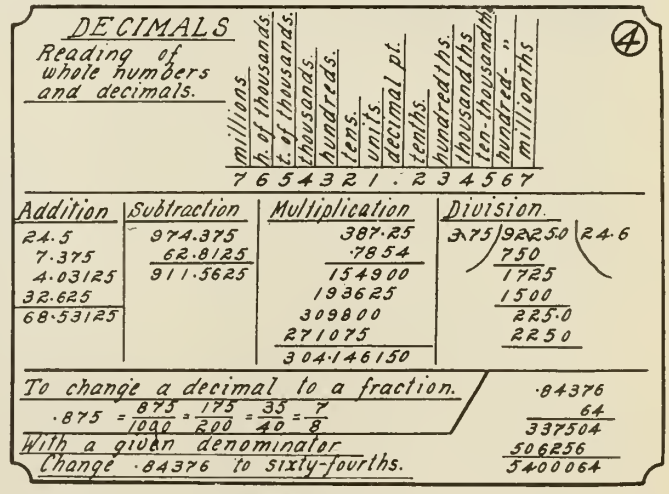
Multiplication of Decimals.

Multiply as in whole numbers regardless of the position of the decimal point. In the product, point off from the right as many places as there are decimal places in the multiplicand and multiplier, adding ciphers if necessary.



Division of Decimals.

Place the divisor to the left of the dividend. If the divisor is a decimal, cancel or remove the decimal point, and move the decimal point in the dividend to the right an equal number of places; then divide as in whole numbers. Consider the point in the dividend as a figure, and place it in the quotient when met with in the process of the division.



To change a fraction to a decimal annex ciphers to the numerator and divide by the denominator. Point off as many decimal places in the quotient as there are ciphers annexed.

To change a decimal to a fraction. Under the figures of the decimal, place 1 with as many ciphers to its right as there are decimal places in the decimal, and reduce this fraction to its lowest terms.

To change a decimal to a fraction having a given denominator, multiply the decimal by the given denominator. The integral part of the product will be the numerator of the fraction.

ARITHMETIC CHART 3.

ARITHMETIC CHART 4.

Percentage.

Percentage is the process of calculating by hundredths. The sign of percentage is %, and is read per cent.; thus, 7% reads seven per cent. The different elements used in percentage are:—base, rate per cent., percentage, amount and the difference. The base is the number on which the per cent. is computed; the rate is the number of hundredths of the base to be taken; the percentage is the portion of the base indicated by the rate; the amount is the sum of the base and the percentage, and the difference is the remainder obtained by subtracting the percentage from the base:—(see Chart 5)

To show to what power a number is to be raised, a small figure called an exponent is placed to the right and a little above the number: thus, $4^2=4\times4=16$, and $12^3=12\times12\times12=1728$.

The number being raised to the required power is called a root of that power. To find any power of a number, multiply the number by itself as many times as there are units in the exponent.

Evolution is the reverse of involution, being the process of finding the root of a number which is considered as a power.

The square root of a number is that number which, when multiplied by itself, produces the number. Thus, 9 is the square root of 81, since $9\times9=81$.

To extract the square root of a number, see Chart 6.

Example:—To find $\sqrt{121104}$.

Begin at the units place, and separate the number into periods of two figures each. Thus 12, 11, 04.

Find the greatest number whose square is contained in the first or left hand period; write this figure as the first figure in the root, also write it to the left of the given number. Thus.

3 12, 11, 04 3.

Multiply this number at the left by the first figure of the root, and subtract the result from the first period, then annex the second period to the remainder. Thus, 3 12, 11, 04 3

9

—

311

Add the first figure of the root to the number in the first column on the left, and annex a cipher to the result. This is the trial divisor. Divide the dividend by the trial divisor for the second figure in the root and add this figure to the trial divisor to form the complete divisor. Multiply the complete divisor by the second figure of the root, and subtract the result from the dividend. If this result be larger than the dividend, a smaller number must be used for the second figure of the root. Annex the third period to the last remainder for a new dividend. Add the second figure of the root to the complete divisor, and annex a cipher for a new trial divisor. Thus, 3 12, 11, 04 34

3 9

— —

60 311

4 256

— ——

64 5504

4

—

680

Continue in this manner to the last period.

3 12, 11, 04 348.

3 9

— —

60 311

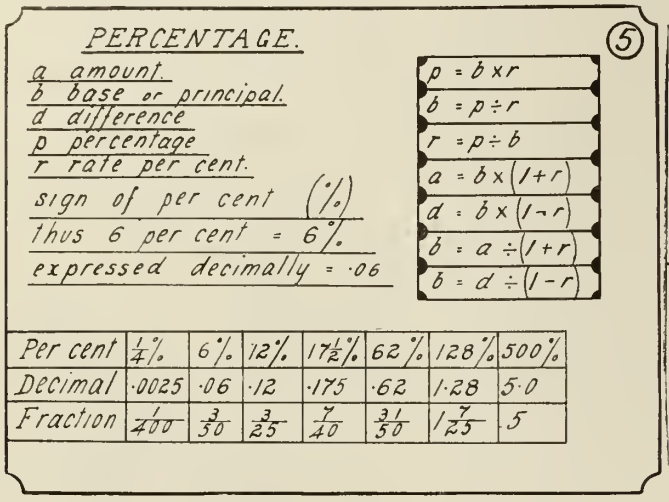
4 256

— ——

64 5504

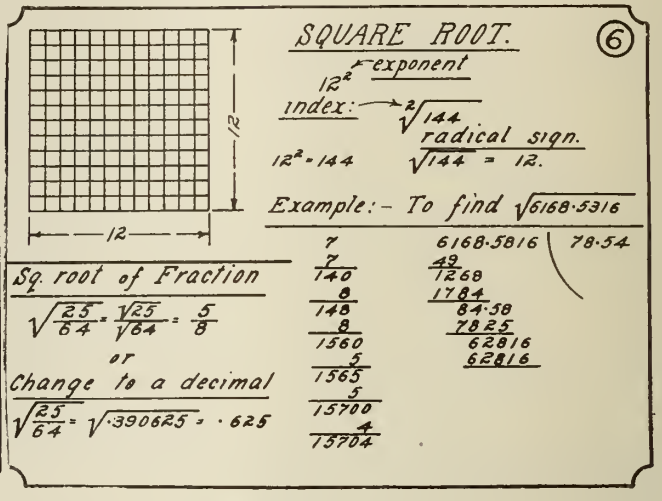
4 5504

—— ——



680

8



——

688

Then $\sqrt{121104}=348$.

ARITHMETIC CHART 5.

ARITHMETIC CHART 6.

Example:—The output of a certain factory was 275 cars a year; by the introduction of new machinery, the increase in production was 18%. What was the new output?

Here, the 275 is the base; the rate 18% expressed in hundreths is 18/100 or .18; the percentage of increase is the base × rate, or $275\times.18=49.50$.

The amount or new output would be the base, 275 + the percentage or increase, 49.50; or, by direct formula, the amount=base × (1+rate), or new output $=275\times(1+.18)=275\times1.18=324.50$.

Involution and Evolution.

This section which is much used and almost indispensable in the solution of many mathematical problems, although apparently quite difficult when first studied dissolves itself, like most others, into an application of the four elementary principles of arithmetic:—addition, subtraction, multiplication and division.

The product obtained by multiplying a number by itself is called a power of that number. This process is called involution. Example, $3\times3=9$, then 9 is the second power of 3, and the third power of $3=3\times3\times3=27$.

The cube root of a number is that number which, when multiplied by itself three times produces the number. Thus, 4 is the cube root of 64, since $4\times4\times4=64$.

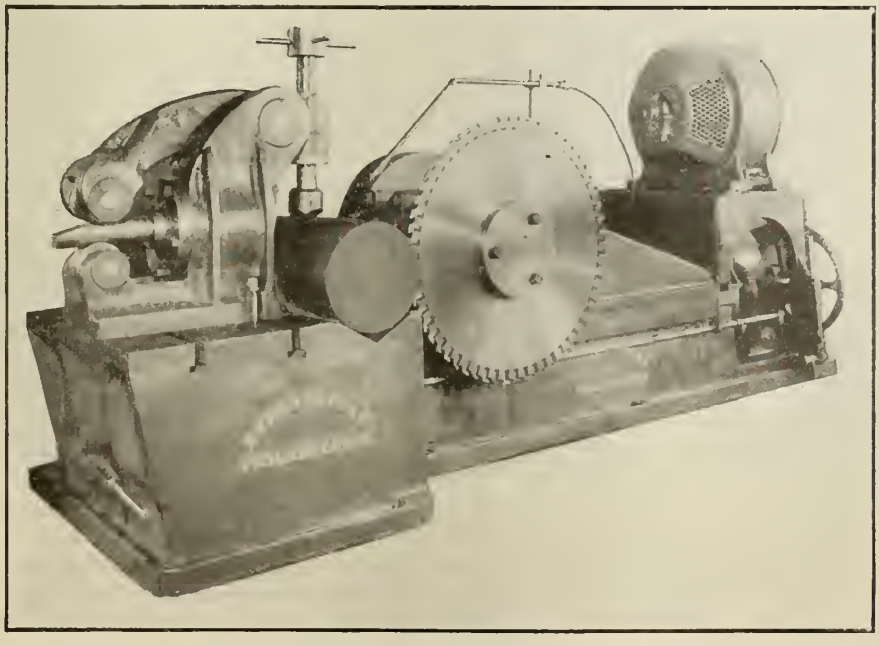
The radical sign $\sqrt{}$ when placed before a number, indicates that some root of the number is to be taken, and, to indicate what root is required, a small figure, called the index, is placed to the left and above the radical sign. Thus,

$\sqrt{16}$ denotes sq. root of 16.

$\sqrt[3]{343}$ denotes cube root of 343.

$\sqrt[4]{27.42}$ denotes fourth root of 27.42.

DEVELOPMENTS IN MACHINERY

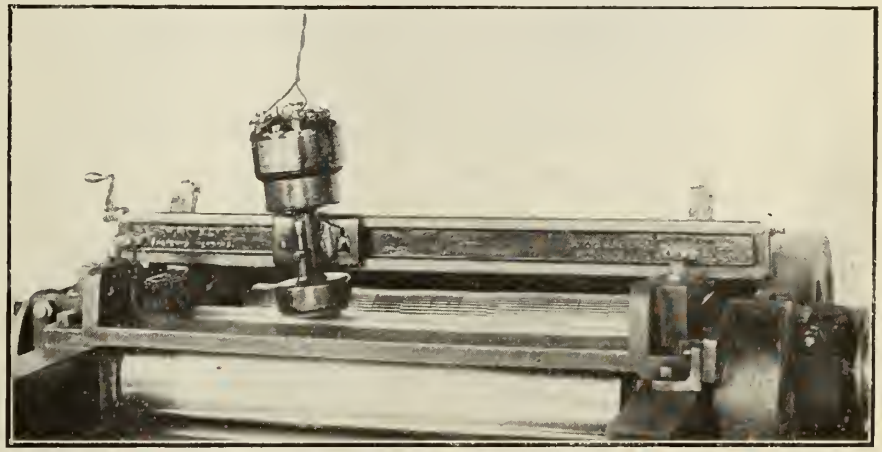


A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

HEAVY TYPE COLD SAW CUTTING OFF MACHINE.

THE illustration and text refer to a recent production of the Espen-Lucas Machine Works, Philadelphia, Pa. This consists of a new heavy duty, rapid production cold saw cutting off machine, carrying a blade 60 inches in diameter, and having a capacity for sawing round or square bars up to 20 inches in diameter. The feed and speed variations are such that the saw can, if necessary, be fed forward at the rate of 6 inches per minute.

The drive is through a main shaft, with a phosphor bronze worm wheel and crucible steel worm running in oil. The spindle extends the entire width of the carriage, and the saw blade is bolted directly against the driving gear, insuring rigidity and avoiding torsional strains between the driving gear and the blade. The feed is obtained from a geared friction plate controlled by an automatic lock nut lever, by which any change in cutting speed can be made while the machine is in operation. The saw carriage also has a quick return controlled by the same lever. An automatic stop for controlling the travel of the carriage is also provided. With this machine any type of saw blade, including the inserted teeth blade or solid high-speed steel types, may be used. Plain screw clamps or pneumatic clamps are supplied with the machine, according to the customer's requirements; and for rapid hauling of stock, where multiple cuts are to be made, the machine is equipped with a stock feed attachment capable of handling bars of any length up to twenty feet.



The usual drip pan, as furnished on machines for sawing smaller stock, has been omitted, and in its place a reservoir in the foundation has been substituted. The machine is belt-driven by a 35 h.p. motor, and weighs about 50,000 pounds.

HEAVY TYPE COLD SAW CUTTING-OFF MACHINE.

KNIFE GRINDER.

THE need for a machine that will quickly and accurately grind the knives of planers and jointers without the trouble of taking the knives off the machine, has for some time been recognized by users of wood-working machinery. The time spent in removing knives and putting them back properly adjusted is a difficult and unsatisfactory task. The work is often done hurriedly and improperly, resulting not only in poor work, but inefficiency in production. This is especially true of the thin, hard knives used on modern cylindrical head planers which it is almost impossible to grind on an automatic, and reset in perfect alignment the entire length of head. The requirements of a knife grinder are:—That it must grind true; be adaptable to all makes and sizes of planers; be easily attached, and be light enough to be easily carried from machine to machine. In the "Quicsharp" grinder all these requirements, it is claimed, have been combined.

GRINDER ON SURFACER

The "Quicsharp" grinder is motor driven, the motor being mounted in grinder head. Current is taken from an ordinary lamp socket To the saddle is attached a split nut engaging the feed screw which lays along the top of bridge. The saddle can be fed the length of the bridge in either direction and at any speed desired. The bridge is supported at the ends, or any point most convenient by two angular brackets which are bolted to the jointer bed, holding the grinder perfectly rigid. The grinding wheel which is cup-faced, can be raised or lowered by a thumb-screw and can be set to grind the required amount from knives, automatically feeding itself to a positive stop. In the grinding wheel is a tension spring which maintains a constant and uniform pressure on the grinding wheel, but never too much, thus

eliminating all danger of overheating and burning the knives. The grinder head is pivoted at the centre and can be tilted to either side of the perpendicular. It is held in place against a stop giving the same angle on either side. The tilted head gives a concaved grind to the knives. A positive stop holds each knife in exactly the same relative position to the wheel; therefore, each knife must be ground true to the bed. One illustration shows the "Quicsharp"

GRINDER ON JOINTER.

grinder attached to a B. D. Whitney & Son surfacer. When used on a surfacer, the angular brackets are reversed, being held in place by fixed pins located in the frame of the planer. These pins fit into holes in the foot of the bracket. Adjustments having once been made for each machine, it is only necessary when using the grinder to place it in position on the supporting pins.

A summary of some of the features and advantages of the "Quicsharp" grinder are as follows: — A pair of knives once put on a machine are never taken off until worn out. Harder knives can be used than is possible with the old method of whetting knives with a file and oil stone. The knives are always in perfect alignment with the bed and with each other, making each knife do its share of the cutting, thus insuring smooth and accurate work. With cylindrical head planers, the knives are so thin and pliable that it is very difficult to grind them on an automatic and put them back on the machine in perfect alignment. A great deal of time is used up adjusting knives. With the "Quicsharp" grinder, knives are ground to a razor-edge right on the machine in five to ten minutes, where it is usual for an operator to spend one-half to three-quarters of an hour, two or three times a day. With a "Quicsharp" grinder, there is no excuse for idle machines. If a nail or gravel stone is run into, usually, instead of having to take off the knives and adjust a new pair, a few minutes with the grinder will clean up the gap and get work started again without any serious delay. Machines will take care of from 25 to 40 per cent. more work than with the file and oil stone method. In the shop where the grinder was first used, four buzz planers, it is stated, are now doing the work with ease, that required five before its use, and with a reduction of one-half in the cost of knives. If one man takes charge of the grinding of knives, using the grinder once a day, the knives will be in better shape than the most expert operator could otherwise keep them. The care and adjustment of knives is a most important part in the operation of planers.

The "Quicsharp" grinder is manufactured by the Stockbridge Machine Co., Worcester, Mass., who also make the Stockbridge Patented Two-piece Crank Shaper.

LARGE DOUBLE CRANK PRESS.

A LARGE double crank press, built by the Niagara Machine & Tool Works, Buffalo, N.Y., embodying the latest improvements in press design, is shown in the accompanying illustration. The press is intended for punching and forming operations for steel car work, but is also suitable for a wide range of heavy stamping operations.

The bed, housings and arch are held together by means of four steel tie rods 4½ in. diameter, which are shrunk in place. The slide and gibs have the same convenience for adjusting as all large presses built by the firm. The motion of the press is controlled by a hand

LARGE DOUBLE CRANK PRESS.

lever operating a powerful jaw clutch. The working surfaces of the three jaws of gear hub, as well as clutch collar, are faced with hardened tool steel pieces. An automatic device is provided to stop the slide at the highest point of the stroke. The press measures 84 in. between the housings, and weighs about 50,000 lbs.

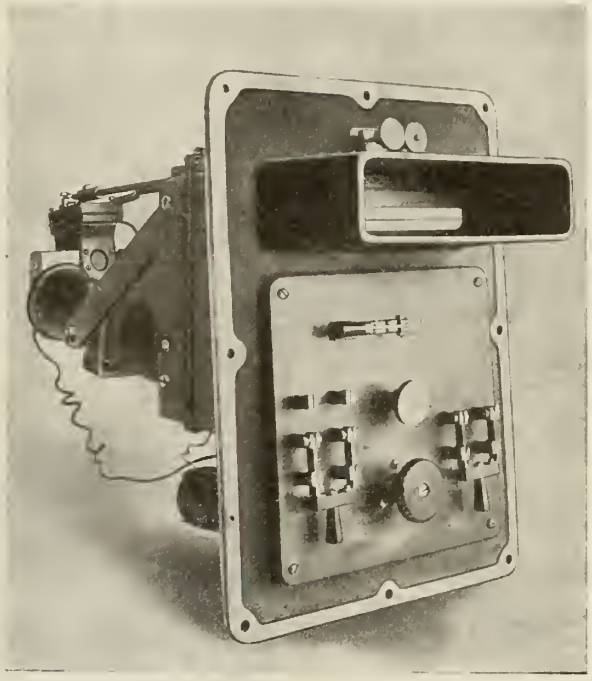
TWIST DRILL MANUFACTURE.

WHAT is claimed to be a revolutionary development in the manufacture of twist drills is the new process inaugurated by the Wilt Twist Drill Co. of Walkerville, Ont. Heretofore it has been necessary to put the drill through half a dozen or more different machining and hand processes in the course of its manufacture, and, while it has unquestionably been possible to produce an extremely good type of drill in this way, the Wilt Company claim a still higher degree of perfection for the drill made by their new method.

The Wilt process is automatic. It applies the principle of the automatic screw machine developed to a high degree to the manufacture of drills, and does at a single chucking the work that under the old process required a number of separate chuckings. The carbon or high-speed steel is fed into the automatic machine in the form of a long rod; the rod is cut off at the proper length for the drill; the end of this rod is grasped by the chuck; a series of roughing cuts brings the grooves of the drill down to within fifteen one-thousandths of an inch of its completed state, and the finishing cut completes the process. The relieving cuts are then made and the drill is released from the chuck, a finished product excepting the hardening, polishing and grinding.

It is claimed for this process that it insures absolute accuracy and uniformity. The grooves are determined with scientific precision, and the clearance is clean cut and well defined. The hardening is done in electric furnaces, in which the heat is effectively regulated. Nothing is left to chance or guess work, every drill being hardened to the exact degree which best adapts it to the work that it is intended to do. Testing and inspection are features which also have close attention.

The plant in which these drills are made is new throughout, built of steel and concrete, and is equipped with the most modern devices for economical and efficient manufacture. The Wilt drills are now being placed on the market, and are, we understand, meeting with a favorable reception wherever they have been introduced.

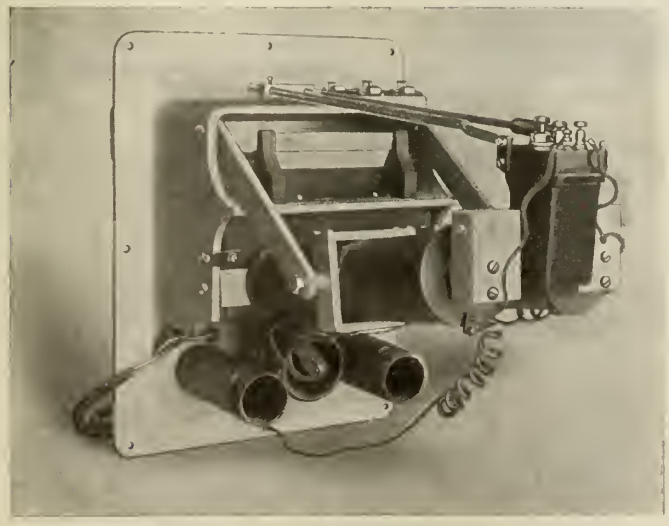


M. P. Fennell, acting secretary-treasurer of the Montreal Harbor Board, has left to join Chairman W. G. Ross in Europe, where they will study harbor conditions.

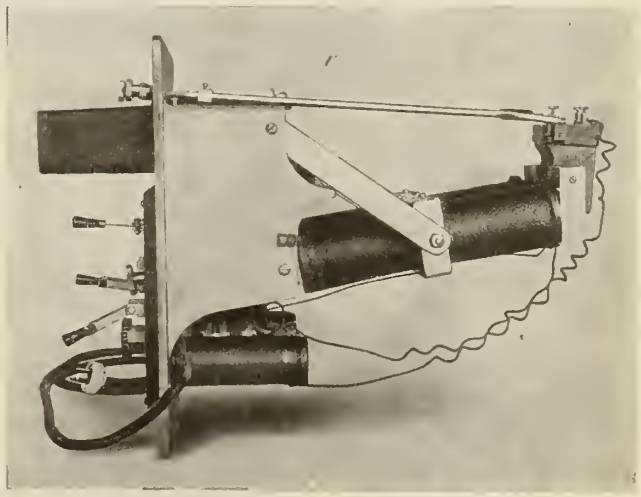
NEW TYPE VOLTMETER.

IN the testing of insulated wires and cables designed for a great variety of purposes, a voltmeter as we have known it heretofore, often fails to measure adequately the stresses to which the dielectric is subjected. Based on the integration of the sine wave—on the square root of the mean square of instantaneous values — voltmeter readings give little or no indication of unusual peaks in the voltage wave or of surges in the circuit.

The need of an instrument which would give such readings arose in connection with the high voltage testing of wires and cables, it being well-known that, in such tests, the peak of the wave is what counts in breaking down the insulation. So long as a sine wave is maintained, the ordinary voltmeter indicates the peak voltage—a definite percentage above the voltmeter reading, but in cable testing, there is a considerable charging current, due to the electro-static capacity of the cable. As this current is likely to distort the wave form, the ordinary voltmeter may give no definite information as to peak voltage.



After trying and discarding both a spark gap, which proved to be too easily affected by outside conditions, and an oscillograph, which is too delicate an instrument for factory use, the engineers of the Simplex Wire & Cable Co., Boston, proceeded to develop for their own use apparatus which would give the required results. Based upon the principle of the oscillograph, but with its movement confined to a straight line, the new instrument, illustrated herewith, indicates the peak of the voltage wave at the limit of oscillation along that line. It does not show the character of the wave or the form of its peak, but it does give very clearly the reading for that peak, whatever the shape of the wave may be. This peak voltage meter, in its original crude state was used successfully in the Simplex factory for some time, and thus thoroughly tested out. It has just been completed in its present form, after an experimental period extending over two years.



FRONT VIEW—SIMPLEX PEAK VOLTAGE METER SHOWING CONTROL BOARD AND SCALE.

The voltmeter, which is of switchboard type, measures about 10 by 12 in. on the front and 14 in. deep. It consists essentially of a heavy electro-magnet, between the poles of which is located the vibrator. By a suitable arrangement of lamp, mirror and lenses, a beam of light is thrown on a ground glass scale in front, graduated in volts. This instrument is connected, through a potential transformer, directly on the high voltage circuit, the current being so small that the apparatus can be left in the circuit all the time. It can be quickly calibrated at any time by applying direct current of known voltage.

This interesting example of the development of an invention to meet a particular factory need might prove of considerable value in other lines as well as that of the manufacture of insulated wires and cables, but its principal indication is the readiness of the American manufacturer to undertake both the deep study and the careful experimental work needed to provide him with the tools with which his regular work can be carried on to best advantage.

REAR VIEW—SIMPLEX PEAK VOLTAGE METER, SHOWING DETAILS OF CONSTRUCTION.

GENERAL CONSTRUCTION OF NEW METER.

D. W. Wright, manager of Gunn's, Limited, has been recommended for the position of manager of the new Toronto civic abattoir. The Board of Control has approved the appointment, and the salary named is $3,500.

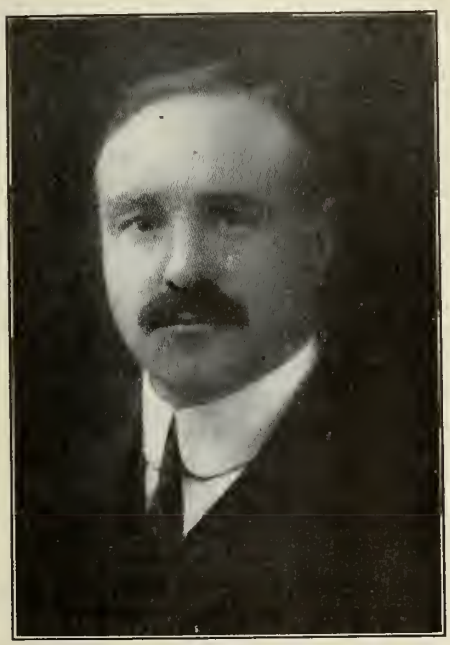
IS MATERIAL SUCCESS THE GOAL?

SUCCESS as generally understood is for the most part and has been in all time associated with the acquirement and accumulation of things material, and, of course, failure of necessity implies the lack of these.

"The man who succeeds at thirty is often a failure at forty," says a writer, and to show that the claim to be called successful at thirty is based on material acquirement, the writer goes on to say that "there may be observed a great many men in business around the age of thirty who have made considerable money, who own an automobile, and have acquired a certain amount of what we style the world's goods." We do not dispute the fact that, measured by wealth or worldly possessions or both, the experience is a common one, and, even when tested by a standard of worth higher than tin or tinsel, there is no lack of examples of men who have also deteriorated in the moral sphere, between these ages. Notwithstanding the latter, however, the inference that success means tucking away ducats loses nothing of its force and reality.

Again, would the transition from implied affluence at thirty to some state or condition of existence at forty where the term affluence if suggested, would unhesitatingly be dubbed sarcasm, of necessity constitute failure? Unreservedly no, and dare we dogmatise as materialistic and unregenerate writers are so prone to do, and conclude that any man so circumstanced is less of a success at forty than at thirty. We trow not. Wealth or worldly possessions do not make the man, whether those have been his birthright or whether his own efforts have been instrumental in harvesting them, and no superficially applied title of success or failure in the respective circumstances and embracing, if you like, a century of years instead of only ten years will alter this basic and all-important Christian principle.

To quote further from the same writer, we are informed that "the principle that the man who doesn't succeed is the man who deserves to fail is dawning in the eastern sky," and that "if we do not rise above a mere job, a mere daily wage, etc., we have nobody to blame but ourselves." For downright egotism, impudence and presumption we challenge the pages of history and literature for a parallel to the above, and were it not for the fact that through the series of writings from which these extracts have been taken, other more or less contradictory and unwarrantable statements are made, and all ostensibly, mark you, for the elevation of the toiler in every sphere of labor and enterprise, a grave importance might easily be attached to and disastrous results ensue from the broadcasting of such unwholesome teaching. It happens, however, there is evident disorder in the brain box from which this type of teaching emanates, not dissimilar in effect to the striking mechanism of a cheap clock when some tangle in its wheel train causes it to ring three when the dial indicates and the hour in reality is four.



As an indication of the above condition, we quote the following query and reply, from the same source as the others. Someone is represented as saying, "what of the man who worked hard, who believed in himself and went down to failure." Well, "out of failure and out of mistakes a man's strength really comes." There is here sufficient indication of an application of the requirement and training of the individual life, and were those whose temperament is so constituted that it does not seem to them to matter whether the clock is striking the right hour so long as it strikes, to take counsel with themselves, take themselves to task and refrain from dictating to others concerning the fundamentals of their being, of which, after all, they are by no means so ignorant as they get credit for, or if, in other words, "everybody kept their own doorstep clean, the whole street would be clean," there would be a considerable and widespread increase in the output of effort towards the general uplift and well-being.

Failures, as we said a week ago, are the stepping stones to success, and we are almost certainly to have been mistaken in our judgment that the man with cash, automobile and real estate at thirty had secured the latter, and just as certainly in error that the same man at forty without these was a failure. Material measurement of men is the curse of our time, yet character and performance of duty as we know how, are and will continue to be in demand, when real work has to be done and achievement small and great is needful of accomplishment.

INDUSTRIAL NOTABILITIES--No. 24

JAMES FRATER TAYLOR, president of the Lake Superior Corporation, Sault Ste. Marie, Ont., is the son of Alexander and Mary (Frater) Taylor. He was born at Aberdeen, Scotland, on March 23, 1873, and was educated in the public schools of that city.

His first important undertaking was in 1902, when he took an active part in the reorganization of the electric railway system at Madras, India. His connection with Canada began in 1909 when he was appointed third vice-president of the Lake Superior Corporation and director of a number of the subsidiary companies. At the same time he took in hand the reorganization of the corporation on behalf of financial interests principally in London, England. The more important subsidiary companies at that time were, and still are, the Algoma Steel Corporation, the Algoma Central Railway and the Algoma Eastern Railway. The Algoma Steel Corporation at that time had a capacity of 500 tons of pig iron per day and a rail mill capable of producing about 700 tons of rails per day, with two furnaces to take care of the entire output. The Algoma Central at that time was badly handicapped by having no proper outlet; being more or less incomplete and having inadequate terminal facilities. During the past five years

JAMES FRATER TAYLOR.

the development of the Lake Superior Corporation and subsidiary companies has been proceeded with. The plant of the Algoma Steel Corporation has been enlarged and has now a capacity of 1,000 tons of pig iron per day. New open-hearth furnaces have been built and rail mills remodeled, the result being an increased output to 1,200 tons of rails per day. A large and up-to-date power plant has been installed and coke ovens built to obviate the necessity of importing that material. The Algoma Central will shortly be in operation as far as the junction point with the Canadian Northern Ontario Railway, and later will connect up with the Grand Trunk Pacific Railway. Rapid progress is also being made in the construction of the Algoma Eastern Railway from Sudbury. The terminals have been equipped with large ore and coal docks.

In October, 1913, Mr. Taylor was made president of the Lake Superior Corporation and of the various subsidiary companies, being also on the Board of the Lake Superior Paper Company.

Mr. Taylor, in 1898, married Frances Alice Hill, daughter of Joseph Hill. They have one son and two daughters, and live at Sault Ste. Marie, Ont.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., March 2, 1914.—Salesmen report little improvement in trade over last week, cautious buying being still the rule in almost all lines. The dullness of trade is strongly evidenced by the shrinkage in railway earnings and by the reduced banking and Customs clearings. The report of the C.P.R. for January, recently issued, shows a decrease in net earnings of 39 per cent., as compared with January, 1913. The earnings for that month, however, were much above the average, owing to favorable weather, combined with activity in all branches of commerce. Perhaps a surer test may be found in the Customs returns for Montreal, which for the month just closed show a decrease of $362,662, as compared with the returns for the same month last year. However, an improved state of affairs may doubtless be looked for in the course of a month or two from now.

The general opinion appears to be that 1914 will be a year of fair prosperity for manufacturers. There is not likely to be much done in the way of plant extensions, and in many cases manufacturing methods are likely to be carefully revised with a view to reducing unit costs and effecting all possible economies.

The present position of Dominion Steel stock bears witness to the weak state of the Canadian steel industry at present. Steel interests in the United States, however, expect a revival of buying orders this month. The present lack of business is largely attributable to the want of railroad orders; so that a general resumption of business that will increase railroad earnings should bring about a marked improvement in steel conditions.

There has been a fair buying movement in pig iron during the past week or two. Inquiries, however, have been mostly for second half delivery, and, since the recent advance in prices by American and Canadian furnaces, sellers are not very willing to accept contracts for second half delivery.

Copper remains at last week's prices, but there is little doing. A revision of prices downwards may be expected shortly in electrolytic, following a reduction in New York. Tin is back to the figure it stood at about a month ago; but this metal is subject to a great deal of market manipulation at present, and, though immediate prospects are for a continuance of comparatively low prices, the London syndicate may decide otherwise.

Toronto, Ont, March 3, 1914.—Generally speaking, the condition of the market shows no change over last week, prices as a rule remaining firm. From what we hear substantial improvement is not expected to take place just yet. The structural steel business is quiet, and will remain so until the weather shows signs of moderating and building activity becomes more pronounced. Reports from the United States show that the mills are increasing their output, and that the improvement is expected to be maintained. This is an encouraging reminder of the gradually improving conditions in the steel business in the States, and indicates what may be expected to take place in Canada later. The Steel Company of Canada state that they find business very fair, with distinct signs of improvement. They report no change in prices. A structural steel concern in Hamilton state that they anticipate an improvement in trade, and they consider prospects are looking brighter.

Dealers in machine tools consider that the market generally is quiet, but that prospects are improving. A number of small orders have been booked, but no large specifications appear to be in sight. The Canadian Buffalo Forge Co. are buying equipment for their new plant at Berlin, Ont., an order for two electric traveling cranes having been placed here. A local firm have recently sold some "V. & O." presses to a new company starting up at Hamilton, and also to the National Cash Register Co. for their new Toronto plant. The motor boat show at the local Exhibition Grounds seems to have been a decided success. One firm exhibiting marine engines state that a number of inquiries have been received, and that prospects look bright for the coming season. The Polson Ironworks have been busy all this winter, and will be having several launches during the immediately coming months, the first taking place this week. Their yard is full up with work, and they have in addition several nice contracts coming along.

The tool steel and mill supply business shows a little improvement, although no substantial increase in the volume of business can be reported.

The metal market is quiet, a fair number of small orders are being booked, but no heavy buying is taking place. Prices are stationary, being the same as last week.

SUBMERGED FIRING.

IN the Zeitschrift fur Dampfkessel und Maschinenbetrieb, recently, Privy Councillor Jaeger gives an account of the Brunler system of submerged firing. He points out that hitherto the construction of steam boilers has been based on the heat produced by the processes of combusion being conducted to the fluid in the boiler through its walls. This system involves very considerable losses both of heat and material. The Brunler "Greek fire" method of submerged firing is at first sight startling, but Mr. Jaeger describes the Brunler boiler which has been used with great success by the Wesenfeld, Dicke & Co., chemical factory at Dahl, near Langerfeld. The boiler plant consists of a cast steel generator in which the flame burns under the surface of the liquid, and of a cast iron collector or the liquid, the steam, and the gaseous products of combustion. The fuel used is coal tar oil.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Rainy Lake, Ont.—The M. & M. A. Deans Co., are moving their hub factory to Sprucedale, Ont.

Weyburn, Sask.—The Acton & Montgomery Co., are in the market for an oxy-acetylene welding plant.

Toronto, Ont.—The Polson Ironworks are in the market for a doubled-ended punch, a 5-ton locomotive crane and a number of light air tools.

Brantford, Ont.—The Waterous Engine Co. has been granted a six months' rebate of taxes on certain property, on recommendation of the assessors.

Fort William, Ont.—The Canada Iron Foundry are very busy now, a full staff of workmen being employed full time. Orders for cast iron pipe for Fort William, Edmonton, Moose Jaw and Swift Current are in hand.

Galt, Ont.—The Shurley-Dietrich Co. has its handle factory in full operation, and all hands belonging to the plant destroyed by fire have been given employment of one kind or another. The company plans resuming operations on a larger scale, but when and where has not yet been disclosed.

Dundas, Ont.—The Dickson Building Co. has purchased the old Maw & McFarlane foundry from Alex. Galbraith, and will completely remodel the entire structure. The north side of the building has been leased to the Dominion Mineral Water Co., of Toronto, who will manufacture mineral waters on a large scale.

Ford, Ont. — A. N. Lawrence, sales manager of the Ford Motor Co., of Canada, Ltd., reports that Tuesday, Feb. 24, was a record day for the automobile factory at Ford. On that day the Ford plant built 105 cars and shipped 129. This is the largest production and the greatest activity for any one day in the history of the Canadian plant.

Sarnia, Ont.—The Mueller Mfg. Co., of Sarnia, has increased its capital from $300,000 to half a million. The rapid growth of the business justified the increase, and this spring it is planned to make a considerable increase in the number of men employed. New machiney, costing $20,000, will be installed, such as lathes, moulding machines, steam hammers, etc., and it is understood that other building extensions will be made to the plant.

Collingwood, Ont.—By a vote of 712 to 259 the ratepayers of Collingwood voted on Feb. 24 in favor of a by-law authorizing the town to guarantee the bonds of the Imperial Steel and Wire Co. to the amount of $10,000. The company in question will extend its works by the erection of a wood screw factory, which will give employment to 120 men in addition to the 200 already employed in the wire works. Colonel Currie, M.P., is the president of the company.

Montreal, Que.—A formal notice has been issued confirming the recent announcement that the Northern Electric Co., Ltd., has acquired the business and undertakings of the Imperial Wire and Cable Co., Ltd., and the Northern Electric & Mfg. Co., Ltd, subsidiaries of the Bell Telephone Co., of Canada. The officers of the new company are E. F. Sise, president; Paul F. Size, vice-president and general manager; Clement Sare, secretary, and G. W. Jones, treasurer.

Electrical

Runnymede, Ont. — It is considered highly probable that the hydro-electric will be here this summer.

Dundas, Ont.—The townships of Ancaster and Beverley are asking the Ontario Hydro Commission to extend their power lines to these districts.

Weston, Ont.—A petition signed by a large number of ratepayers will be sent to the Ontario Hydro-electric Commission, asking for the service to be extended to the district east of this village.

Vineland, Ont. — The hydro-electric meeting, held at Vineland recently, was addressed by Engineer Purcell, who explained to the ratepayers of Clinton township the terms upon which the Ontario Commission will furnish power to the municipality.

Toronto, Ont.—The towns of Listowel, Chesley, Harriston, Wiarton, Clifford and Mount Forest want hydro-electric. The engineers are looking into the matter as to the advisability of obtaining current from Eugenia Falls in the Owen Sound district, or from Niagara Falls.

Windsor, Ont.—The first step in the purchase of the Walkerville Light and Power Co. by the Hydro Commission was taken when Hydro Commissioner Hatcher interviewed Mr. Murphy, manager of the Light and Power Co., for the purpose of having an inventory taken and presented to the commission for consideration.

Halifax, N.S.—Halifax has a lively hope of soon getting cheap electric power. The Nova Scotia Power Co. now developing Gaspe expect to be able to generate 15,000 horse-power, and run a distribution wire to Halifax. There is a power company to develop electric power from the Mersey, and another on the St. Margaret's River. With the question of cheap power solved, Halifax would have a great many advantages as a manufacturing centre, having the benefits of cheap water freights for the importation of raw materials.

Municipal

Oak Ridges, Ont.—$8,000 for a new school building, passed.

Coquitlam, B.C.—$35,000 as a temporary loan, passed by council.

Strathroy, Ont.—$25,000 for a Hydro-Electric system, carried by electorate.

Windsor, Ont.— An incinerator will probably be installed here in the near future.

Edmonton, Alta.—The city is contemplating the purchase of steel garbage wagons.

Tilbury, Ont.—$10,000 for a Hydro-Electric system and $6.000 for waterworks extension, passed by council.

Vancouver, B.C.—The city has decided to appoint an industrial commissioner Applications should be in by March 2nd.

Sarnia, Ont. — Application will be made to the Provincial Legislature for powers to enable Sarnia to be created a city.

Collingwood, Ont.—$100,000 to guarantee the bonds of the Imperial Steel and Wire Company, carried by ratepayers.

Sarnia, Ont.—The town council have decided to purchase a steam road roller and a concrete mixer at an estimated cost of $3,500.

Sarnia, Ont.—The Sarnia Steam Railway have formulated plans to extend their tracks farther south to the Mueller Mfg. Co.'s plant.

Port Arthur, Ont.—The plans for the proposed water works and sewer construction have been approved by the Provincial Board of Health.

Chatham, Ont.—The city council are again considering the advisability of buying out the Chatham Gas Company. A by-law will probably be voted on.

St. Marys, Ont.—The Water, Light and Heat Board of St. Marys have decided to purchase a graphic meter, at a cost of $350, to check up the hydro readings.

Simcoe, Ont.—The town is considering the question of installing a sewage disposal plant and a complete system of sewers. The estimated cost will be about $200,000.

Sherbrooke, Que.—An active advertising campaign will be conducted with a view of making this town better known as an industrial centre. The town council and Board of Trade are working together.

Winnipeg, Man.—Contracts aggregating approximately one quarter of a million dollars, and covering much of the preliminary work in the Greater Winnipeg water project have been let by the administration board.

Toronto, Ont.—It is estimated that $100,000 will be required for new fire-fighting equipment, which will include ten combination chemical and hose wagons, a hook and ladder truck, two tractors for aerial trucks, and six automobiles for district chiefs.

Shedden, Ont.—A large gathering of ratepayers of Shedden met in Morrison's hall on Feb. 26, to consider the matter of natural gas. The chair was occupied by G. G. Hopkins, and L. B. Morse acted as secretary of the meeting.

Estevan, Sask.—The following by-laws have been carried:—$30,000 for the erection and equipment of a hospital; $69,000 for extensions to the sanitary sewer system; $27,000 to extend the waterworks system; $10,200 for construction of mechanical filter and filter house.

Ottawa, Ont.—City Engineer Currie has presented a report to the city council for an alternative scheme to the proposed water supply from Thirty-one Mile Lake. The new scheme provides for a mechanical filtration plant and reservoir, the estimated cost being $53,000.

Hamilton, Ont.—A number of big works to be proceeded with this year include a power plant for the Dominion Power & Transmission Co. to cost $1,000,000; harbor dredging and general work, $500,000; McKittrick syndicate bridge, $140,000.

Dundas, Ont.—The town is contemplating installing a sewage disposal plant. A committee has been appointed to secure a site and appoint an engineer to prepare plans and estimates. J. F. Armour, consulting engineer, is being retained in an advisory capacity.

Melville, Sask.—Applications will be received by the town clerk until 6 p.m., Monday, March 16th, 1914, for the position of Engineer for the Town of Melville. Applications will please give details of experience in sewage installation and other branches of work, and state salary required.

Toronto, Ont.—The immediate erection of two temporary incinerators, one on the Western Cattle Market annex property, and the other on a site to be provided by the removal of the Street Cleaning Department's present shops at the eastern yards, is advocated by Street Commissioner Geo. B. Wilson in a report presented to the City Works Committee. The total estimated cost of the two incinerators is $74,504.

Toronto, Ont.—Fire destroyed a five-storey building at 579 Richmond Street West on February 26. The firms affected by the fire are—Long & Co., $80,000; Independent Cloak Co., $30,000; Beaver Shirt Co., $20,000; Monarch Clothing Co., $30,000; L. Freifield & Co., $15,000; loss on building, $65,000.

Windsor, Ont.—Ratepayers of the city voted on March 3 to sanction by-laws which will give exemptions to three new industries. The Central Ice and Cold Storage Company proposes to erect a plant with a daily capacity of fifty tons of ice, which will cost in the neighborhood of $150,000. The other two companies seeking to open offices here are the Dowsley Spring & Axle Co. and the Ideal Concrete Machinery Co.

Ingersoll, Ont.—The Ingersoll Gas & Light Co., are busy preparing for the delivery of natural gas in Ingersoll within the time prescribed by the agreement three weeks. Two of their representatives, Messrs. Doherty and R. Wright, are canvassing the town and ascertaining from consumers of gas what changes they will require made in their gas stoves. So soon as the facts are ascertained, the actual changes will immediately follow.

West Lorne, Ont.—A special meeting of the Village Council was held on Feb. 25, for the purpose of considering the by-law and agreement with the Southern Ontario Gas Co. F. B. Thomb, of the latter, and Town Solicitor J. S. Robertson were present. A provisional by-law was passed, and as soon as approved by the votes of the people, West Lorne will be supplied with natural gas. The rate is said to be low, and the agreement is satisfactory to the council.

Montreal, Que.—It is stated that the question of granting a forty-year franchise to the Montreal Tramways Company will be placed before the ratepayers in the form of a referendum at the forthcoming municipal elections. It was indicated that the fact of the elections taking place just six weeks from now made it imperative that the citizens should have a say in the matter as to whether the Tramways Corporation was to receive an addition of thirty-two years to its present franchise, which expires in 1922.

Montreal, Que. — Tenders are being called for fifteen 5-ton and two 3-ton trucks and five runabouts or roadsters. The tenders will be opened on March 5. The Roads Department will have the 5-ton trucks, while the water department will have the 3-ton trucks for carrying pipes, etc. Of the runabouts, three are for officials of the water department and two for the fire department. Additional to the auto trucks the roads department will also purchase this year auto sprinkler-sweepers and auto vacuum street cleaners, the latter being used to pick up rubbish on paved streets.

Chatham, Ont.—As a result of a conference with the city council, the following concessions were settled upon, to offer prospective industries. Exemption from taxes not to exceed ten years. A fixed assessment not to exceed ten years. All assistance possible in the securing of a site. If a concern wishes to take advantage of the borrowing powers of the city in the shape of a loan, the city will, after becoming satisfied as to the financial standing of the concern, advance $1,000 for every $3,000 put into the plant and the city's portion shall not be paid over until the investment is made by the company.

Stratford, Ont.—The citizens of Stratford, by overwhelming majorities, voted in favor of three industrial by-laws which were placed before them. The Morlock by-law, which grants a $2,500 site to the John Morlock Upholstering Co. of Hanover, and fixes the assessment at $7,500, was carried by 1,550 votes to 121. Another by-law, which gives a $3,500 site and a fixed assessment of $7,500 to the Diebel Furniture-Frame Co., also of Hanover, went through by 1,557 for and 114 against. The third by-law fixes the assessment on the Stratford Manufacturing Co. at $7,500, and won out by 1,584 to 87.

General Industrial

Vancouver, B.C. — Bettschen & Higgins will build a boiler house.

Vancouver, B.C.—The British Columbia Sugar Refinery Co. will erect a two-storey factory to cost $2,500.

Guelph, Ont.—A Chicago firm, manufacturing counters and showcases, will locate their Canadian factory in Guelph.

Chatham, Ont.—It is planned to submit a by-law for granting a bonus to the Concrete Products Co. A previous by-law was defeated.

Brampton, Ont.—The Lindus Co., Ltd., are asking the town for a loan of $20,000 for a term of 15 years. They propose to erect a factory costing $50,000.

Maple Creek, Sask. — The Canadian Hunt Mfg. Co., have selected a site for their new factory and preparations will shortly be made for building.

Kingston, Ont.—The Board of Trade have received an application from a company desiring to locate here. No details are being given out at present.

Welland, Ont.—A Hamilton, Ont., company are preparing to build a brick and tile factory here. A site has been purchased of about nine acres.

Sidney, N.S.—W. A. Winfield is interested in a company who are proposing to establish a plant for distilling and bottling water for drinking purposes.

Regina, Sask.—The Western Tire & Rubber Co. will build a factory here, 300 x 60 ft. It is stated that $175,000 will be spent on buildings and equipment.

Lindsay, Ont.—The Cole-Berger Co., will probably build a new factory this spring. The town has loaned the company $12,800 towards the purchase of new machinery.

Windsor, Ont.—J. T. Wing & Co., Detroit, Mich., manufacturers of factory supplies, will build a plant here. The building will be 100 x 100 ft., and three storeys high.

Owen Sound, Ont.—It is understood that a company is proposing to buy the match factory here and equip a plant for manufacturing chemicals. Mr. William Campbell is interested.

London, Ont.—The London & Petrolia Barrel Co., which has been incorporated, will continue to enlarge its plant each year, although no extensive improvements are expected this season.

Ingersoll, Ont. — The Southern Ontario Gas, Co. contemplate installing a natural gas system. The town council have sanctioned the scheme. Mr. Lowery is general manager of the company.

Brampton, Ont.—The town council is considering the request of the Copeland-Chatterson Co., for a loan of $40,000 without interest as a bonus for a new factory which they propose building.

Bridgeburg, Ont.—The plant of the Canada Foundry Co. here was closed Tuesday and Wednesday last week on account of difficulty in obtaining sufficient gas supply with which to operate.

Regina, Sask.—Leitch Bros., Oak Lake, Man., will erect a 3,000-barrel flour mill, a 300,000-bushel elevator, a 200-bag oatmeal plant and a cooperage and bag factory here. The buildings to be erected will cost $300,000.

London, Ont.—Five thousand dollars' damage was done to the stock of the Dominion Meter Co., by a fire, said to have been caused by an attempt to thaw out some pipes with a gasoline torch. The loss is covered by insurance.

St. Catharines, Ont.—On account of the Consumers' Rubber Co., by-law being defeated, the city council have authorized the industrial commissioner to reopen negotiations with the company with a view to inducing them to locate here.

Niagara Falls, Ont.—The Automatic Parcel Checking Co., will probably build a factory here if the citizens will interest themselves to the extent of $10,000. No concessions are asked except the usual terms given to manufacturers for power and water.

Waterford, Ont. — The Universal Chemical & Electrical Co., have purchased an existing factory building here and will manufacture telephones, electrical fixtures and electrical sundries. Brantford capital is interested and Albert T. Jacobs is general manager.

Medicine Hat, Alta. — The Carlyle Creamery Co., of this city, according to W. M. Henderson, the manager, will erect a large plant as soon as building operations open in the spring. A large pasteurizing plant, fully equipped in every detail, will be installed.

Welland, Ont.—Steel is now being delivered on the Electric Steel and Metals Co.'s site, and the erectors, the Standard Steel Construction Co., will begin construction work the latter part of this week. Contractor Gardner will start brickwork as soon as steel work is completed.

Fingal, Ont.—J. D. and Wm. Davis intend building a large addition to their evaporating factory. This buisiness has grown so that the present building is inadequate to accommodate the supply of apples brought in, and the addition will be commenced as soon as the weather is warmer.

Winnipeg, Man.—It is understood that the Austin Paper Co., of this city, is having plans prepared by the Albertson Engineering Co., Kalamazoo, Mich., and Toronto, Ont., for the erection of a board mill, which will use flax straw for the making of board, and that construction will go ahead this spring.

Hamilton, Ont.—The Willys-Overland Co. of Toledo, automobile manufacturers, who recently purchased the old Jackson Typewriter building in Sanford Avenue, when it decided to establish its Canadian branch in Hamilton, is arranging for large extensions. Plans have been prepared for a new building, 210 by 65 feet, and three storeys high. Work will begin at once.

Perth, Ont.—The electors of Newboro will vote on a by-law on March 16 to decide the question of bonusing the Ontario Milling & Manufacturing Co., who intend re-opening the canning factory. A bonus of $200 per year for 10 years is contemplated, with the usual fixed assessment, etc. Seventy-five hands will be employed for at least six months in the year.

Vancouver, B.C.—The contract for the Hudson's Bay Co.'s department store in Victoria has been awarded to the B.C. Construction and Engineering Co. The work of construction will be commenced within a few days. The contract price has not been announced, but it is between $700,000 and $800,000, exclusive of the cost of excavation, and also the mechanical equipment.

Victoria, B.C. — An order-in-council was passed on February 21, authorizing immediate purchase of Lang's Cove drydock site at Esquimalt. This decisive step confirms previous predictions as to Victoria being the premier shipbuilding port and naval base on the Canadian Pacific Coast. The next step of the department will be to rush the preparation of plans and specifications and call for tenders.

Vancouver, B.C. — The James M. Davidson Fisheries, of Edinburgh, Scotland, will erect a fertilizer plant on the Skeena River, British Columbia. At present the canneries on the river make no use of the refuse of their plants, and representatives of this firm have entered into contracts with these canneries for the sale of their offal. The machinery is to be shipped from Scotland, and it is expected that the completed plant will cost in the neighborhood of $100,000.

Swift Current, Sask.—Owing to the increased demand for their product, the Swift Current Cement Products Co. will increase the capacity of their plant at once. The building will be enlarged and much new machinery installed, among the latter being machinery for the manu-

facture of cement sewer tile. In addition to the cement blocks and sewer tile, cement fence posts and ornamental columns will be manufactured. The company will employ twenty-five men when the changes are made.

Melfort, Sask.—A new grain company has been formed at Melfort, Sask., for the encouragement of the grain industry in the Carrot River Valley. The company is capitalized at $200,000. It is proposed to erect a number of elevators in the district, and it is also possible that a flour and cereal mill may be erected if it be found that the supply of grain justifies the establishment of this industry. A number of the citizens of Melfort are backing the new scheme, and the grain company with good management is expected to prove one of the leading assets of the district.

Sarnia, Ont.—A large number of boilermakers are now at work on the Imperial Oil Co.'s plant placing several new crude stills in position on the river side of the refinery. In all about ten of these new stills are under way, and it is expected that more will be put up as soon as possible. At all parts of the plant a great amount of new work is being done, and it is expected that as soon as the weather sets in fine more men will be added to the force. The new acid house, near the Pere Marquette roundhouse, is about completed, with the exception of a few details. Work about the motor spirits plant is being pushed along rapidly.

Refrigeration

Harriston, Ont.—The large cold storage building of the William Davies Co. has been temporarily closed. It is announced that business will be abandoned at this plant until the arrival of hydro power.

Fort Francis, Ont.—The York Manufacturing Co., York, Pa., recently installed a 4-ton vertical, single-acting, belt-driven enclosed type refrigerating machine, and high pressure side complete, in the Fort Francis Hotel here.

Medicine Hat, Alta.—President Pearson of the Medicine Hat Pure Ice Co., and Mr. Davidson of the same concern, are completing arrangements with the city for a site for their ice plant. It is understood that the site has been secured and without doubt an agreement will be entered into at once. The plant will be one of the largest of its kind, and the firm are contemplating the building of a large skating rink and curling rink in addition to the ice making plant. It is their intention to have the plant completed in time for the summer ice trade.

Railways-Bridges

Paris, Ont.—The Lake Erie & Northern Railway have laid their tracks within the limits of the town.

Brantford, Ont.—A by-law will be introduced this week at the city council meeting for the purchase of the Brantford Street Railway.

Port Arthur, Ont.—The city is to apply to the legislature immediately for the extension of its street railway into the townships of McIntyre, Goreham and Ware.

Toronto, Ont.—The councils of the counties of York and Ontario have decided to build two bridges to cost $7,000. The bridges will have a span of 40 feet and be constructed of steel and concrete.

Chatham, Ont.—As the result of a gas explosion in the generating plant of the Chatham, Wallaceburg and Lake Erie Electric Railway three men were seriously injured and the frame boiler room was completely wrecked, leaving the five boilers exposed to the elements.

Brantford, Ont.—The Lake Erie and Northern Railway will make application for the increase of its bonding power from $30,000 per mile to $45,000 per mile. The application will come before the railway committee of the House of Commons, but the city will not be a party in any way.

Ottawa, Ont.—In the Private Bills Committee, sitting on February 24, the bill of the Niagara-Welland Power Co. was considered. This company is asking a charter to dispose of the power that will be developed by the building of a new Welland Canal.

Vancouver, B.C. — The date for the closing of tenders for the construction of the Second Narrows bridge is fixed for April 1. It is understood five big contracting firms in Vancouver will compete for the construction of the bridge, and that a number of tenders will be received from firms in Eastern Canada.

Montreal, Que.—It is stated here that the Canadian Northern will have its western terminals at Calgary. Report also says that the Great Northern, which is about to construct a line into Alberta, may agree with the Canadian Northern to have a union station at Calgary. In any case, it is said, the Great Northern's depot will be on the east side.

Petrolea, Ont.—At a recent meeting of the town council a deputation to represent Petrolea at the hydro radial convention on March 5, was appointed, consisting of Mayor R. Stirrett, Reeve Dr. C. O. Fairbanks, Deputy Reeve Burgess and J. C. Waddell, chairman of the fire, water and light committee.

Ottawa, Ont.—It is announced that a commission will be appointed to inquire into the commercial feasibility of the Georgian Bay Canal. The names of the commissioners have not been made public, but it is thought that Sanford Evans, of Winnipeg; Col. F. Meighen and Edward Gohier, of Montreal, will be appointed.

Ottawa, Ont.—A holding company with a capital of $10,000,000 to be known as the Ottawa Traction Co. has been formed to take over the stock of the Ottawa Electric Railway Co. It is proposed that three shares of stock in the new company shall be issued in exchange for every one share of Ottawa Electric Railway.

Melbourne, Ont.—Residents are in favor of routing the proposed London-to-Glencoe hydro radial line this way, and it is probable that deputation from Melbourne will ask the councils of Caradoc and Ekfrid to use their influence in that behalf. It is desired that the line will run from Delaware along the Longwood road to this place and continue to Glencoe.

London, Ont.—Hydro engineers are already going over the route of the London and Port Stanley Railway in connection with the electrification scheme. The matter of other radials in the district hooking up with the city's road will also be looked into. The line from Aylmer has been surveyed, and it has been found that, in view of the level country, the bulk of construction work will be reasonable.

Victoria, B.C.—Bonds of the Canadian Northern Pacific Railway to the further amount of $5,110,000 are to be guaranteed by the Province of British Columbia, a bill for the purpose having been introduced in the legislature by the premier. This will make a total of $47,950,000 of Canadian Northern bonds guaranteed by the Province, with probably some more to be announced in the near future.

St. Thomas, Ont.—Representatives of St. Thomas, Aylmer, Yarmouth, and Malahide met here to consider a proposal to guaranteed the bonds of the London & Lake Erie Transportation Co. for an extension of the radial line from St. Thomas to Aylmer, and from Union to Sparta. It was agreed to guarantee the bonds to the extent of $20,000 a mile, but there is a difference as to apportioning the amount to be borne by the municipalities.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

Personal

N. C. Peterson, of Sarnia, died there, aged 80, on February 24. Mr. Peterson was in the foundry business for many years.

A. F. McCallum, city engineer of Hamilton, Ont., has left for Key West, Fla., where he will spend a vacation of two weeks.

Fred. Mitchell has resigned his position with the Otis-Fensom Elevator Co., Hamilton, after being with them over twelve years.

O. B. Mueller, of the H. Mueller Manufacturing Co., has returned to Sarnia, Ont., from New York, where he had been on a business trip.

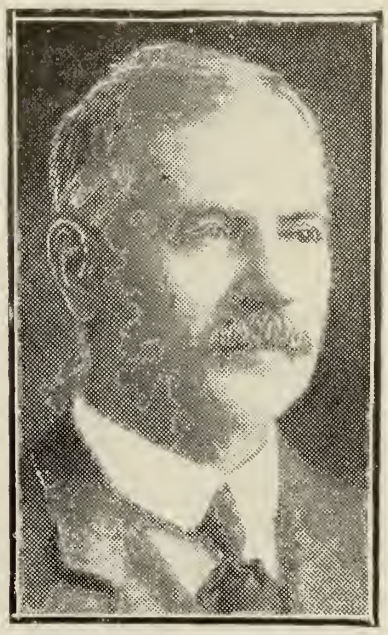
F. W. Wanklyn, C.E., former controller of the City of Montreal, and assistant to the president, C.P.R., was 54 years old on February 25.

Capt. J. D. Macpherson, wreck commissioner, has returned to Victoria from Vancouver, after holding an investigation into the loss of the steamer Vadso.

F. Ross Newman, resident manager in Toronto of the Canadian Fairbanks-Morse Co., Ltd., has returned from Europe, having been away about six weeks.

D. B. McCoy, formerly chief clerk of the Steel Company of Canada at Belleville, Ont., has been appointed traveling salesman for the same organization, with his headquarters in Belleville as formerly.

E. C. Stokes, of Hamilton, Ont., has been recommended for the position of street commissioner for the Town of Woodstock, Ont., at a salary of $1,200 per annum.



Ferdinand de Lesseps' Statute.— The "Matin," Paris, states that Myron Herrick, the United States Ambassador to France, has asked the U.S. Government to erect a statue of Ferdinand de Lesseps at the entrance to the Panama Canal.

E. H. Bennett, of Chicago, the town planning expert, has been engaged to prepare plans for the City of Ottawa, working under authority from the Government. Mr. Bennet made similar plans for Chicago and other large cities.

R. Winslow has been engaged by the Board of Harbor Commissioners, Vancouver, as harbor engineer, and will be retained in that capacity for the present to look after the drafting of plans and other work of a general nature in connection with the harbor.

J. H. Plummer, president of the Dominion Iron and Steel Co., does not seem to be perturbed over the fact that business is very dull. Telegrams come to him respecting orders wherever he goes. He wears a confident smile, seeing, as he does, considerable sunshine behind the present clouds.

G. M. Kennedy, factory superintendent of the Massey-Harris Co.'s works on King Street West, died at his residence, 466 Indian Road, on February 27, where he had been confined for a week with pneumonia. The late Mr. Kennedy was born in Blenheim Township fifty years ago, but moved to Woodstock later, where he was employed with Patterson Bros., coming to Toronto in 1885. He is survived by his wife, one daughter and one son. He was for some years foreman, then assistant superintendent of the Massey-Harris works, and was appointed superintendent about five years ago. Mr. Kennedy was considered by his employers to have had exceptional executive ability, and was very popular with the men. His death, which came unexpectedly in the prime of life, is keenly felt by the directors and officials of the company.

THE LATE G. M. KENNEDY.

Herbert S. Holcroft, D.S.L., of Toronto, has left for Fort Churchill, on the Hudson's Bay. He will go via Winnipeg and Le Pas, Man. As a Dominion Government official, Mr. Holcroft is going north to lay out a townsite at Churchill, as it is now called, under the supervision of the Department of the Interior.

P. A. Galarneau has just resigned his position with J. H. Gignac & Co., with which firm he had been connected for fifteen years, to take up the position of general manager of the Citadel Brick and Paving Block Co., Quebec, made vacant by the death of the late Mr. Fred Thorn.

Vancouver, B.C.—Davis & Leslie, consulting engineers, 119 Pender Street West, have been appointed harbor engineers to lay out the North Arm of the Fraser River by the North Fraser Harbor Commissioners. The engineers will begin their work just as soon as the funds voted by the municipalities concerned are available.

Athol Davies, the stationary engineer who was badly burned when an explosion of natural gas occurred on Tuesday morning, February 24, and wrecked the boiler-room at the generating plant of the Chatham, Wallaceburg and Lake Erie Railway, Chatham, Ont., died at St. Joseph's Hospital on February 27. John Montague and William Roberts, firemen, who were also injured, are progressing favorably, and will recover.

The Polson Ironworks will build two 24-in. suction dredges for the Canadian Stewart Co. for work on the Toronto Harbor improvements. The dredges will be 170 ft. long, 42 ft. beam, and 12 ft. deep. They will be each equipped with four 400 h.p. Babcock & Wilcox semi-marine type boilers, and 1,500 h.p. triple expansion engines, driving a centrifugal pump. The engines will be supplied by the New York Shipbuilding Co., Camden, N.J.

A. O. Backert, editor of "The Foundry" and general manager of The Penton Publishing Co., Cleveland, Ohio, has accepted the position of secretary-treasurer of the American Foundrymen's Association, which was tendered him shortly after the resignation of Dr. Richard Moldenke, on January 17. Mr. Backert will enter upon his duties as soon as Dr. Moldenke completes the current volume of transactions, which work he is now bringing to a close.

"WILLIAMS" MACHINERY LIST

NEW PLANT FOR SALE

We have just bought the machinery from the Maritime Motor Car Co., Ltd., of St. John, N.B., and offer same at greatly reduced prices.

10 Pneumatic Riveters, Monarch; Hammer 1 1-16" x 3½"; made by Standard Railway Equipment Co., St. Louis. Size, 04. Working weight, 11 lbs. Length of tool, 14". Cub. ft. free air per min., 15. To be used with ½" air hose. Working extra heavy, chipping and light riveting up to ½".

1 Brown Instrument Co. Stationary Electric Pyrometer.

1 No. 3 Barnes Screw Press; 30" between uprights. Maximum distance under the screw, 36". Capacity, 50 tons pressure.

1 No. 3 Stewart Muffle and Oven Furnace, arranged for case-hardening and annealing, also arranged with heavy brick-lined doors, also oil burners complete with blower.

1 No. 4 Foster Geared Friction Head Screw Machine. Wire Feed capacity, 1 9-16". Dia. of hole through spindle, 1⅞". Complete with automatic chuck. Wire feed and power feed of cross slide.

1 Walker style D Grinder, complete.

1 Electric Blue Printing Machine, Eugene Dietzgen Co.

3 220-volt, alternating current portable Electric Drills. Size, 3". Dimensions, 4½ x 13½. Weight, approx. 19 lbs. Drills in steel ½". Speed under load, 250 to 400 revs. per min.

2 No. 2 D Power Forges, Buffalo Forge Co.

1 Sclerescope for testing steel.

1 2½" x 4" x 1 Plain Milling Cutter, sq. keyed.

Nine sets of Nickerson Expanding Mandrels, as follows:—
1 to 1¼", 10".
1¼ to 1 9-16", 11¾".
1 9-16 to 2", 14¾".
2" to 2½", 17½".
2½ to 3¼", 18¾".
3¾ to 4", 21".
4" to 5", 23¼".
5" to 6", 25".
6" to 7", 25".

1 No. 4 Grinding Machine, with self-oiling bearings for 14" dia. wheels. 4½" bearings. Distance between wheels, 17½". Height, 37". Weight, 310 lbs. Wheel guards can be attached.

One set of seven-straddle milling cutters:
3 x 5-16 x 1
3 x ⅜ x 1
3 x ½ x 1
3 x ¼ x 1
3 x 7-16 x 1
4 x ¾ x 1
4 x ½ x 1

IF IT'S MACHINERY WRITE "WILLIAMS"

The A. R. Williams Machinery Co., Ltd., 64-66 Front St. W., Toronto

Tenders

Toronto, Ont.—Tenders for transformers will be received by the Toronto Hydro-electric System up to March 12.

Winnipeg, Man.—Tenders will be received until March 23, for the supply and delivery at Lac Du Bonnet station of one steam locomotive complete with tender and snow plough. Specifications and form of tender may be obtained from the office of the city light and power department, King street, Winnipeg.

Ottawa, Ont.—Sealed tenders, addressed to L. K. Jones, secretary Dept. of Railways, and marked "Tender for Section No. 2, Severn Division, Trent Canal," will be received until 12 o'clock noon on Monday, March 23rd, 1914. Plans, specifications and forms of contract to be entered into can be seen at the office of the chief engineer of the Department of Railways and Canals, Ottawa; at the office of the superintendent engineer, Trent Canal, Peterborough; Ont.; and at the office of the district engineer, Public Works Department, Midland, Ont.

Humboldt, Sask.—Sealed tenders will be received by the secretary-treasurer until 8 p.m., Wednesday, April 15, for the following works.—(A)—Labor laying water mains and sewers. (B)—Pump house and filter house. (C)—Furnishing material for and erecting water tower. (D)—Furnishing cast iron water pipes. (E)—Furnishing fire hydrants and valves. (F)—Furnishing and installing pressure filters. (G)—Furnishing and installing pumping machinery. (N)—Furnishing wood stave pipe. (O)—Laying wood stave pipe. (P)—Constructing ejector station. (S)—Furnishing sewer pipes. (X)—Constructing sewage disposal works. Plans and specifications may be seen at the office of the engineers, Toronto and Winnipeg, and at the town hall, Humboldt, on and after March 16th. Chipman & Power, engineers, Toronto.

—

Contracts Awarded

Fort William, Ont.,—The city council have decided not to engage an engineer to report on a sewage disposal system.

Winnipeg, Man.—The tender of the Canadian Westinghouse Co. of $16,828 was accepted for the supply and delivery of switching apparatus for the King St. sub-station.

Hamilton, Ont.—The Hamilton Bridge Co. has been awarded the contract for the erection of the McKittrick Bridge, which is to open up the east end of the city. The bridge and approaches will cost $120,000.

Vancouver, B.C.—Grant Smith & Co., and McDonnell, Ltd., two Vancouver firms which tendered jointly for the construction of the new Victoria wharves and docks, have been awarded the contract at $2,244,795.

St. Catharines, Ont.—The Lord and Burnham Company of New York have awarded to The Samuel Austin & Son Co. of Cleveland and Thorold, Ont., the contract for the erection of their new factory building at St. Catharines. The steel work will be done by the Standard Steel Construction Co. of Welland.

Winnipeg Man.—In accordance with the suggestions of the manager of the city light and power department, the council passed the board's recommendations that the single-phase pole type transformers contract be awarded to the Canadian Westinghouse Co. Chapman & Walker, Ltd., were given the the three-phase pole type transformers contract, while the Canadian Maloney Electric Co. was awarded the contract for the single-phase subway transformers.

Catalogues

The Canadian Westinghouse Co., Ltd., Hamilton, Ont., are distributing a leaflet describing the properties and method of operation of their "Ozonizer" apparatus. A complete description is given also of a list of commercial applications.

Steam Pumps are dealt with in Catalogue No. 9 recently issued by the Smart-Turner Machine Co., Ltd., Hamilton, Ont. Several types are illustrated and a brief description given of each.

"**Lagonda Cut-off Valves**" is the title of an attractive catalogue which has been issued by the Lagonda Mfg. Co., Springfield, O. The valves and other specialties manufactured by the company are illustrated and described fully, the illustrations including views of several installations. Copies of this catalogue may be had by writing.

Automobile Battery Charging is the subject of a folder, 4201-5-13, recently distributed by the Canadian Westinghouse Co., Ltd., Hamilton, Ont. The folder illustrates and describes the Westinghouse Cooper-Hewitt Rectifier Outfits for charging electric automobiles in garages. The last page contains a list of various sizes of battery-charging outfits and accessories.

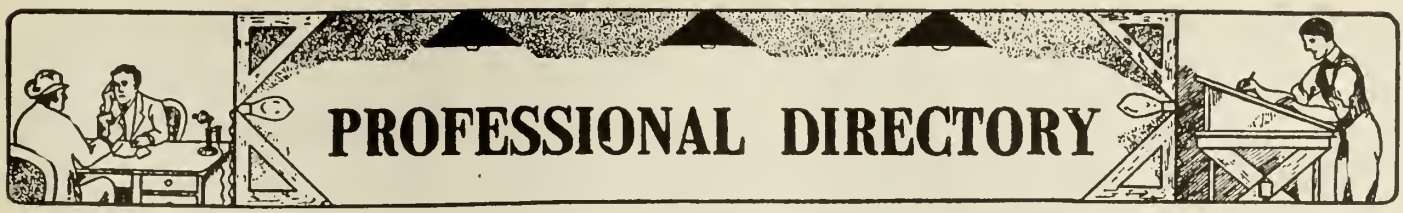
Canadian Billings & Spencer, Ltd., Welland, Ont., have issued a new catalogue dealing with the extensive line of machine wrenches and tools which they make. Each specialty is illustrated and tables are included, giving the principal dimensions for each size. Illustrations are also shown of various samples of drop-forging work. Copies may be had on request.

Jackson's Utility Vise is dealt with fully in a pamphlet received by us from the Brown Engineering Co., Reading, Pa. The pamphlet states that this vise is suitable for drill presses, millers, shapers, etc., and for die, mould and tool makers. The illustrations show the vise under varying conditions of service. A description is given together with a specification. Copies of this pamphlet may be had by writing.

The Morse Chain Co., Ithaca, N.Y., has issued a pamphlet, No. 12, entitled the "Morse Long-Service Chain Drives." The pamphlet consists of a number of short descriptions of typical "Morse" silent chain drives showing their durability and efficiency for long periods of time. Each installation is illustrated, and a summary is given of all the drives. The pamphlet concludes with particulars regarding the design and operation of the "Morse" chain.

The Niles-Bement-Pond Co., New York, have sent us a copy of their new catalogue dealing with the "Niles" electric traveling cranes. This is a handsome production containing many illustrations of electric cranes operating under various conditions, indicating their wide range of service. The principal constructional features are illustrated and described in a comprehensive manner. The Canadian Fairbanks-Morse Co., Ltd., Toronto, Montreal, etc., are the Canadian sales agents.

Braby's Handbook has been sent us by Frederick Braby & Co., Ltd., London, Eng. This handbook is intended for engineers and those interested in galvanized iron, sheet metal products of all descriptions, and structural steel. The catalogue contains illustrations of various grades of galvanized sheets, many examples of architectural ironwork, steel structures, steel tanks, and interior views of the company's rolling mills at Glasgow, Scotland. Particulars are given of roofing sheets and other products, while the concluding pages contain a number of useful tables. The handbook is indexed and is an attractive, pocket-size publication.



The Canada Machinery Corporation, Ltd., Galt, Ont., have forwarded a number of bulletins covering new designs in wood and metal-working machinery. The bulletins are as follows: No. 504, tenover; No. 303, heavy moulder; No. 1097, 42-in. heavy coach wheel lathe; No. 1103, horizontal punches; No. 1100, 36-in. heavy duty vertical drilling machine; No. 1090, 50-in. rotary planing machine; No. 1096, extra heavy driving wheel lathe; No. 1099, 76-in. portable radial girder drill; No. 1105, all-geared bead lathe; No. 1104, heavy gate shear with turntable; No. 1098, heavy duty double-axle lathe, and No. 1088, 60x60-in. forge planer. Each machine is illustrated and a general description given. Copies mailed on request.

The Industrial Harbor is the title of a very interesting and well-arranged catalogue which we have received from Deutche Maschinenfabrik A. G. (Demag) Duisburg, Germany. The catalogue contains a large number of illustrations of loco cranes, floating cranes and discharge bridges, in fact, views of practically all the lifting and transporting appliances that might be required in any harbor or dock. Views of a patent railroad car dumping appliance are also shown. The illustrations are exceedingly good and are reproduced from photographs taken of the various appliances in operation. The catalogue contains 152 pages, and is well bound with an attractive cover. Copies may be obtained, by interested readers, from the Canadian sales agents, Gerald Lomer, Ltd., Fraser Building, Montreal, Que.

Book Review

A Report on the Bureau of Supplies has been published by the Department of Water, Gas and Electricity Supply of New York City. The report consists of a description of the work done and results accomplished in the reorganization of the Bureau of Supplies during the past two years under the supervision of Elihu C. Church, chief of the bureau, who was appointed by Commissioner Henry S. Thompson. The various systems introduced and procedure adopted are dealt with at length, each main department being treated separately, such as organization and administration, purchasing, inspection, storage and issue, records and accounts. Several charts are included showing the connection between the various departments, procedure charts, orders issued and money spent. There are also a number of illustrations showing interior views of storerooms.

Handbook for Machine Designers and Draftsmen, by Frederick A. Halsey, 494 pages, 8½ x 11 in., 400 illustrations, 120 diagrams and charts, and 400 tables. Published by the McGraw-Hill Book Co., New York. Price $5 net. This is the best book on machine design that we have seen in recent years, and will be invaluable for draftsmen, designers and engineers. The author has had many years' experience in machine design, and was for eighteen years editor of the American Machinist, his experience in that position being responsible for the inspiration which prompted the compilation of this work for, as the author says in the preface, a number of valuable contributions are published in technical journals which after publication are usually never seen again, a great deal of useful data thus being lost. The object of this book is primarily to preserve such contributions as are of direct use to designers of machinery. The book is arranged so that each section begins with a fresh page, and the illustrations and table numbers in each section begin at No. 1, thereby rendering it possible to drop old or introduce new material in future editions. One of the features of this book is the excellence of the diagrams and illustrations, which are fully dimensioned and of such a size that they can be copied direct. Great liberality has been shown in the number of diagrams, illustrations and charts, each subject being well supplied in this respect. The various sections deal successively with materials, mechanisms, machine parts, springs, chains, gearing, bearings, hydraulics, power requirements of machine tools, boilers, compressed air, steam and gas engines, etc. Each subject is treated in a thorough, comprehen-

¶ Those who wish to sell or buy a business, obtain competent help, connect with satisfactory positions, or secure aid in starting new enterprises should not fail to use the Want Ad. Page of "CANADIAN MACHINERY."
¶ If you want to sell or buy a second-hand lathe, planer or any other shop equipment, let "CANADIAN MACHINERY" pick out a seller or buyer for you. How about that second-hand engine or boiler which you would like to dispose of?
¶ "CANADIAN MACHINERY" is the central market place of the machinery trades throughout Canada.
¶ There is always some one looking for just such a proposition as you have to offer.
Rates (payable in advance):—2c per word first insertion, 1c per word subsequent insertion, 5c additional each insertion when Box Number is required. Each figure counts as one word.

FOR SALE

BUFFING AND POLISHING LATHES FOR platers, jewellers and everyone using polishing machines. All sizes in stock, from No. 00 to No. 8. Enclosed type for jewellers, to be driven from below. Our prices are reasonable. Write us. Pendrith Machinery Co., 970 Queen West, Toronto. (11)

MACHINERY FOR SALE—NEW AND SECOND-hand machinery, engines, boilers, wood and iron working machinery and supplies. Write, stating what you require. Prompt and careful attention to all inquiries. The Advance Machine Works Co., Montreal, Que.

FOR SALE—FEW HAND AND AUTOMATIC screw machines; also plain and hand millers. Will sell at low prices. Russell Motor Car Co., Ltd., Toronto. (11)

SITUATIONS VACANT

THERE IS A POSITION WITH GOOD future awaiting some young man who has a knowledge of mechanical engineering and the ability to write intelligent and convincing advertisements describing engineering equipment. The salary at commencement will not be extremely large, but will grow with the man. State full particulars, giving age, experience and salary you would be willing to accept while you demonstrate your ability. Replies will be regarded as confidential. Box 222, Canadian Machinery.

sive, and practical manner, the diagrams and tables, etc., being of great assistance in following the reading matter. Practically all the data required by machine designers and draftsmen has been incorporated, while the concluding fifty pages devoted to mathematical tables help to make the book very complete. This is a desk book and not a pocket book, thus making it possible to include drawings and diagrams sufficiently clear so as to be easily seen and obviating the necessity of folding plates. The reading matter is printed in clear type and the book is bound in substantial cloth covers.

CONTRACT WORK, FORGING

THE SUDBURY CONSTRUCTION & MAchinery Co., Ltd., Sudbury, Ont., have an inch and a half upsetting and forging machine they require for their own use about five hours per day. They wish to run this machine day and night and invite correspondence from users of forgings who are looking for an interesting proposition. (10)

An Extraordinary Drill Made by An Extraordinary Process

The only marked advance that has been made in twist drill manufacture in a quarter of a century is found in the process by which Wilt Twist Drills are made—The entire Drill is completed at a single chucking. Absolute uniformity and accuracy are thus assured.

Try Wilt Twist Drills on your hardest job. Note the clean-cut clearance—the scientific contour of the grooves. Note the way they stand up to their work, and the amount of work they do without regrinding.

Ask Your Supply Man—or Write Direct.

We manufacture Rivets of every description, ½ inch dia. and smaller.

PARMENTER & BULLOCH CO., LTD.
GANANOQUE, ONT.

We Specialize in
ELECTRICAL REPAIRS

The experience we have gained by repairing the machines of all makers, all sizes, all voltages, and currents is rarely secured by the manufacturer. If he makes your repairs it may be as good as before, but no better. When we tackle a job it is our aim to make the weak part stronger than the original—and we invariably do it.

A Job Well Done is an Ad. for Ever

BLOWER DEPT

BETTER SHOP METHODS

Sectional Steel Bins and Shelving furnish a compact repository for stock, tools, etc. Economical, last a life-time, and protect against fire. Promoting order and system, they save time and breakage. Ours are adaptable to any requirements. Sections may be added as needed. We would be glad to tell you more about them.

DENNIS WIRE & IRON WORKS CO. LIMITED

London, Can.

NICHOLSON MADE

90% OF ALL FILES USED ARE NICHOLSON-MADE

The Reasons:

Mechanics like their "feel" and "balance"—and do more and better work with them.

Superintendents know they're uniform in quality and "draw"—and that they tend to insure accurate work.

Purchasing agents know they're safe on price and deliveries — what they want, when they want it, and at the right price.

If you want to decrease your filing costs—increase your output—and insure utmost accuracy in your product—try the plan of "using more Nicholson-made Files." A 15c investment in an extra file usually makes and saves you $1.50. Not a bad return for your money on each file you use!

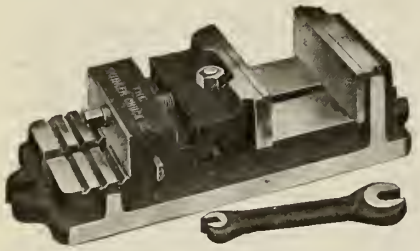
Your Work Cannot Move if You Use S & S Clamping Devices



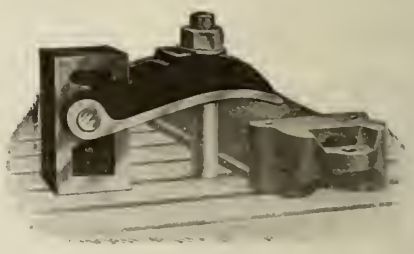


Illustration shows S & S combination clamps, which are equally good for side or top clamping.

We have them in all styles.

Write us for circular and full information.

SCHUCHARDT & SCHUTTE, **307 Coristine Bldg., Montreal**

John Wanamaker says that advertising doesn't jerk — it PULLS. He ought to know, and yet some men think that advertising should go against all rules and precedents and jerk them to success with one tremendous yank.

The advertiser would like to know where you saw his advertisement—tell him.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

CANADIAN MALLEABLE IRON CO. LTD.
OWEN SOUND, ONT.

CASTINGS

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

The "No-Wear" Nozzle

An exclusive feature of the
"Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

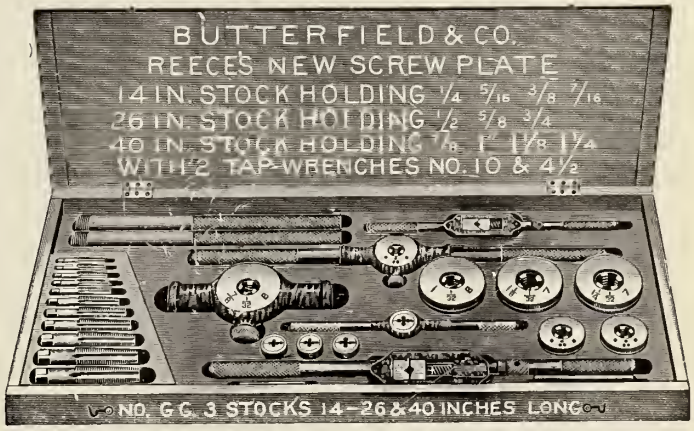
"BUTTERFIELD"



Taps, Dies, Reamers and Screw Plates

If you are not familiar with the quality of our products it will pay you to give them a thorough investigation.

We will be pleased to place you in touch with some users so that you can profit by their experience.

We have been making them for over 35 years and **know** that they are unrivalled.

Why continue using other makes when the "best" is procurable?

Write for catalogue.

Butterfield & Co.

ROCK ISLAND, QUE. DERBY LINE, VT.

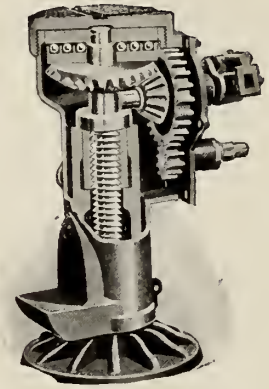
RIVETING COSTS REDUCED BY "TOLEDO" WELDERS

No. 154 Welder, 36-in. Throat

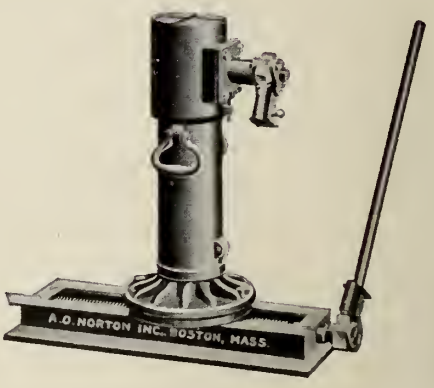
The large daily output of many manufacturers of automobiles and auto parts has been made possible by the use of the "TOLEDO" Electric Welder shown here. With the increased output of their products, **costs have been reduced from 60 to 95%.**

We will prove this by shipping you a "TOLEDO" on 30 days' trial.

Write for our new Bulletins, Nos. 14 and 15. They tell all about "TOLEDO" Butt Welders and Spot Welders.



No Lease. No License. No Royalty.



THE TOLEDO ELECTRIC WELDER COMPANY

CUMMINSVILLE, CINCINNATI, OHIO

INCREASE YOUR JACK EFFICIENCY 300%

Norton Improved High-Speed Jacks have cut down the Time and Cost of Operation and Increased the Jack Efficiency 300% wherever used.

Norton High-Speed Jacks lift and lower their full rated capacity four times as fast as other Ball-Bearing Jacks of Equal Capacity.

The Tap with the Con-eccentric Land

Why Pratt & Whitney Taps Win

The Causes

One-third of the land from the cutting edge is concentric.

The remaining two-thirds has eccentric relief.

The taper-tap has a cylindrical pilot.

The taper- and plug-taps have an eccentrically-relieved chamfer relieved clear from the cutting edge. The highest grade of steel obtainable is used.

These taps are carried in stock by our Branch Offices and Agencies throughout the world.

A Set of Hand Taps as made only by Pratt & Whitney Co.

The Results

Taps can be sharpened at the only correct point—on the face of the cutting edge.

Sharpening in no way affects their size.

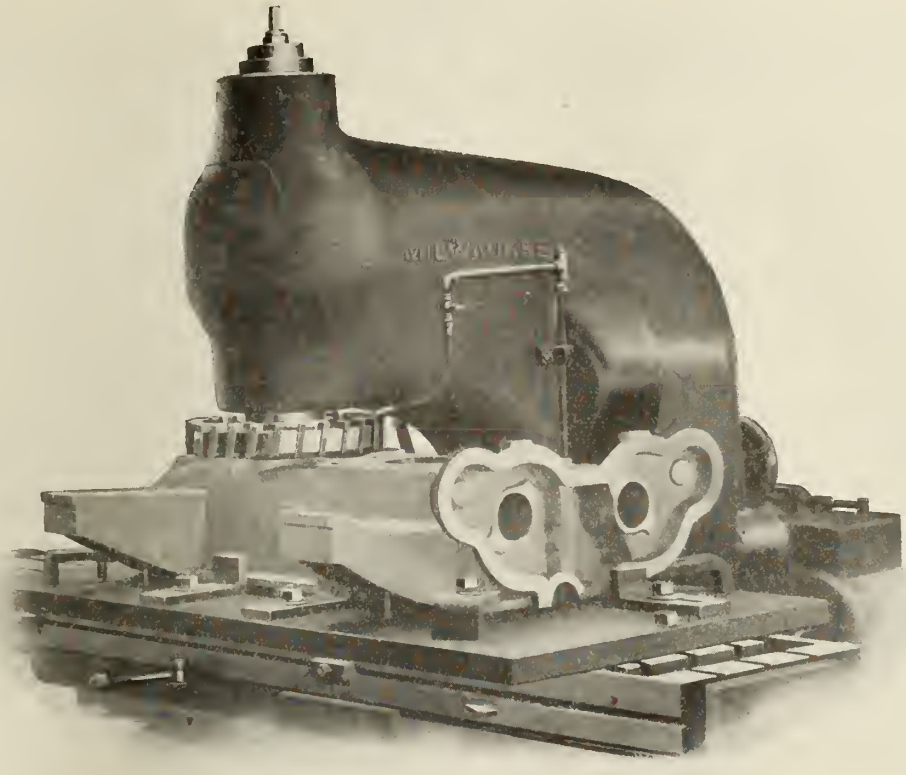
Can be sharpened long after other so-called eccentrically-relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

Prompt service assured to all customers wherever located.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.



We want tap users to know *why Pratt & Whitney taps are best*, also that our claims are based on reasons mechanically correct.

Have you our No. 7 small tool catalogue?

The CANADIAN FAIRBANKS-MORSE CO., Limited, Montreal, Toronto, Vancouver, Winnipeg, St. John, Calgary

Milling an Aluminum Crank Case on a Milwaukee Vertical Miller

The crank case is for an automobile engine. The operation consists of milling that portion of the casting to which the cylinders are bolted.

Aluminum can be milled very rapidly. The cutter used in the operation shown above is 14 in. in diameter and runs at a speed of 200 r.p.m. With the cutter running at this high speed it is necessary that the machine be extremely rigid to prevent chatter and consequent inaccurate work.

In order to secure this extreme rigidity the spindle of Milwaukee Vertical Millers is made non-adjustable, except for wear, and is carried by a solid casting which permits of large diameter drive gear. The knee is made adjustable and is provided with a large diameter collar graduated in thousandths of an inch. Experience has shown that any slight advantage that may be had by the adjustable spindle type on light work is more than lost by its lack of rigidity on medium heavy work—on work such as shown above an adjustable spindle would be decidedly impracticable.

Sufficient adjustment for all practical purposes can be had from the knee alone. And the knee with its large bearing surface on the dovetail of the column is much better fitted for standing fast and heavy cuts than an adjustable head would be.

Aside from the fundamental rigidity of Milwaukee Millers, the chief factor in securing this unusually high speed with a cutter of such large size is our patented automatic cascade lubrication. More than a gallon of oil per minute floods over the large hardened-steel bevel gear on the spindle and the bearings of the spindle. Not a drop of oil can escape past the cupped collar of the spindle. This cupped collar is another patented Milwaukee feature. The oil is all returned to the reservoir in the base of the machine.

The efficient cutter lubrication is important. The special geared pump pours a constant stream of lubricant over the cutter and work. The cutter lubricant is also returned to a reservoir in the base of the machine. This reservoir is distinct from the interior lubricating reservoir, permitting any other lubricant besides oil to be used on the cutters.

The operation shown above contains an interesting suggestion for chucking. A wide plate, considerably wider than the table itself, is bolted to the top of the regular table. For ordinary service it would not be practicable to make a table as wide as this plate. It would not be possible to obtain adequate cross range.

For a job of this character, however, where the cross adjustment can be limited without detriment to the work, a supplementary plate, as wide as may be necessary for the job, can be placed on top of the table. There will be ample room from the centre of the spindle to the face of the column to permit this. If conditions warranted and the nature of the work required it, this top plate could be made with T-slots similar to the top of the table and double the width of the table.

Find out the complete facts about Milwaukee Millers. Apply their great advantages to your own milling problems. Write for our Bulletins.

And, if you desire it, we will gladly give you our ideas, as practical milling mechanics, how you can best and most economically handle any job. Tell us your problem.

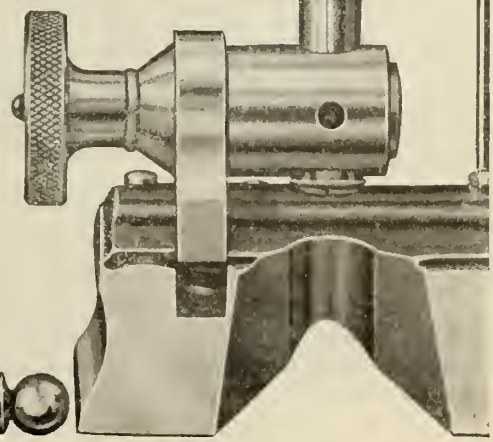
You can't leave Starrett Tools far away on work like this.

Precision Grinding



Progress determined by the use of

Starrett
Instruments of Precision

The difference between perfection and utter uselessness is represented on some grinding work by an amount so small as to be impossible of measurement except by the most delicate of instruments. The Starrett way on work of this kind is to attach a Starrett test indicator to a convenient holder, such as the scriber of a Starrett Surface Gage, and bring the contact point against the work. The tell-tale needle indicates the exact condition of the work. There is no better way.

You will find many kinds of work in the shop where a combination of Starrett tools will give the most accurate results in the quickest way. Investigate your own particular work and see if there is not some way of getting it done better or quicker.

Send for our big, new, free catalog No. 203, which will help in selecting the proper tools.

Fast Cutting—Durable—It Leaves a Better Finish and Saves Time

Aloxite Cloth

The Cloth That Cuts

YOU will note the difference between Aloxite Cloth and the old-time finishing cloth the minute you use it.

Aloxite Cloth cuts—cuts clean and quick—it is uniformly coated, and the Aloxite grains—wonderfully hard, sharp, and tough—stay on. The difference is in speed, finish, uniformity, and economy.

Supplied in sheets or in the economy rolls, ½ to 2 inches wide, mounted on metal spool.

"Health, Kindness and Courtesy"

¶ Everything in this world is largely attitude of mind. No day is beautiful to the man who has indigestion or who has spent the night before at a 'smoker.'

¶ If we radiate good health and good cheer we will get these things back in return. Good humor, courtesy and kindness, pay splendid dividends—and a good long while ago someone said: "As ye sow, so shall ye also reap." This is a fact in Nature, and while we are not indebted to any book or particular individual for this fact, it is, however, a truth which we oftentimes overlook.

¶ A grouch begets a grouch. If a man thinks failure, talks failure, contemplates failure, fears failure, then, verily, failure is on the wing and the spiders are weaving their webs over the door of this man's success. These things constitute what is known as personality, and personality is experience and observation put through a refining process. People with splendid and magnetic personalities have little to say about headaches, indigestion, tonsilitis and appendicitis, because these do not constitute personal magnetism.

¶ The generally accepted theory among intelligent folks nowadays is that a large per cent. of sickness is the result of a large per cent. of foolishness—and people not being anxious to advertise the fact that they have been foolish, silly or indiscreet, say very little about their aches and ills.

¶ If a man sets out in life to accomplish certain things and is willing to sacrifice enough to accomplish his particular purpose, there is hardly any probability that his ambitions will be defeated—unless he should come in contact with a street car or a benzine buggy—and so it is a fact that **we get back just about what we give.**

¶ If we assume an attitude of grief and despair, and carry our troubles, domestic or otherwise, to the office, tell our co-workers about our sleepless night, tell our troubles and ailments to our friends, discuss the latest death with our customers, rehearse the sickness of the community, then we naturally put a clog in the affairs of the day; in other words, we have cut off the power and our business gets indigestion, and if this is kept up sufficiently long, we are sent to the hospital and our business is turned over to our creditors.

¶ If we become excited and angry over the little affairs of the day, get into heated discussions and arguments on politics and religion, tell those who are attempting to assist us that we are not feeling well, then we are preparing for the 'toboggan slide.' If we are to become a power, if we are to dominate, if we are to really hold the reins, to take possession or to take advantage of conditions, then it is necessary for us to store up power, and power, mind you, is not stored up by discussing trivial affairs, by rehearsing disappointments and attending funerals.

¶ The world has had enough of the grouch. The trouble with business, and practically the only trouble with business to-day, is a lot of old-fashioned, old-fogy, out-worn notions which should have been discarded about fifty years ago—or, better still, which should have been lost on the morning the stars were set in the sky. There are just enough of these people in business to-day who start an occasional panic and create a feeling of uncertainty and uneasiness in the business field which gives the entire machinery of things a setback, from which it requires a year to recover.

¶ The principal things that each individual should cultivate more and more are kindness, the work habit, and, above all things else, **the Health Habit.** And just remember this one thing, nothing is so very bad after all. It all depends on the way we see it. If we are to insist on being miserable ourselves, let us retire to the hills and live in a cave or in the crater of an extinct volcano, or let us go where we will not come in contact with other people, where we will not be a burden to those who desire to be happy, to those who desire to do useful work. No man can conduct an intelligent conversation with 'a toothache.' No man can write clearly, lucidly and entertainingly on any subject after he has overeaten, oversmoked or overdrank.

¶ Once more, remember the Moral—we need to cultivate kindness, courtesy and temperance in all things, even if we believe in 'prohibition in none'; and remember also a good place for courtesy and kindness is in your business and among your business associates, as these assets can be and are used for business purposes.

Efficiency

These articles are copyrighted, and must not be reproduced in part or whole without the permission of The MacLean Publishing Company.

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Personal Experiences of Some Modern Methods of Welding*

By Thomas T. Heaton

The facts and figures contained in this article are drawn from the author's personal experiences, for the most part, and cover a period of over twenty years on work relative to welding of a progressive, commercial nature. He expresses the hope that a short, practical survey of the subject will, in view of the increasing interest being shown, be found helpful and instructive.

THE old blacksmith's method of welding by heating in a coke fire and hammering is well known. It is known also to suffer from drawbacks of various kinds. The heat can-

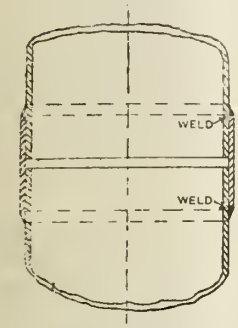

FIG. 1. OUTSIDE BUTT STRAP JOINT FOR AIR RECEIVER AT 100 LBS. PER SQ. INCH.

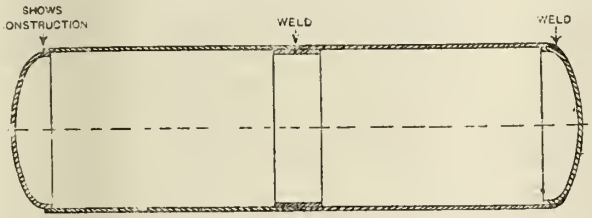

FIG. 2. METHOD OF WELDING ENDS OF VESSEL TO RESIST INTERNAL PRESSURE, ALSO INSIDE BUTT STRAP JOINT.

not always be regulated as well as could be desired. Impurities are often introduced into the joint. The weld itself is sometimes found to be defective, that is to say, it is not welded throughout, and the defect may be hidden, as there may be an outside weld of no depth. Great skill is therefore necessary with this class of welding. The methods the author proposes to describe are quite different, and for certain classes of work produce far superior results to any that the blacksmith can attain. Often welds can be made which no blacksmith could undertake. Broadly speaking, the systems may be divided as follows:—

(A)—Electric welding, in which the heat required is produced by the electric current.

(B)—Gas welding, in which the heat is produced by a gas or mixture of gases.

These divisions may be subdivided, as in both cases there are variations both in method and in means. In electric welding, the chief variations are as follows:—

(1)—The electric arc, as in the Benardos system and its variants.

(2)—The system invented by Mr. Arthur Strohmenger, and owned by Messrs Slaughter & Co.

(3)—The contact system, as in the Thomson-Houston method, The Pontelec, the Helsby and the Allgemeine Elektricitats Gesellschaft.

1.—The Benardos System.

The Benardos System, if properly adapted to the work to be done, and with the plant well designed for generating, distributing and regulating the current, is practical, simple and effective. It demands a direct current of about 90 volts. The quantity of current used depends on the thickness to be welded, and may in ordinary practice range from 200 to 500 amperes. The work itself forms the positive pole of the arc, and a rod of carbon the negative pole. By this arrangement, the greatest amount of heat is in the weld, as the positive pole is the hotter.

Where a number of welders are employed, it is necessary that the current shall be supplied in such a manner that one welder shall not affect the arc of another. This is effected very simply by generating in a compound-wound dynamo of ample capacity; and the machine should be slightly over- rather than under-compounded. By this arrangement, an increase of load does not lower the voltage. In a well-designed machine, the voltage scarcely varies, provided the engine driving it is efficient to maintain its speed. The arcs are arranged in parallel, and each arc

FIG. 3. WELDED CYLINDER TESTED TO DESTRUCTION.

*From a paper read recently before the Institution of Mechanical Engineers.

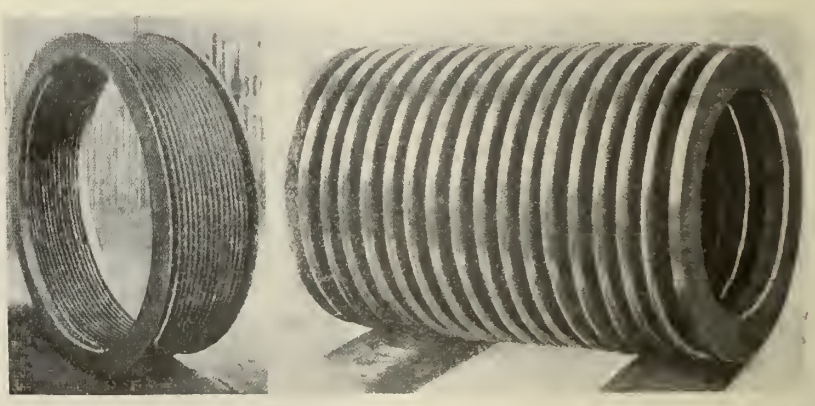
is provided with a regulator to adjust the current to the work to be done. The rod of carbon forming the negative electrode is fastened in an insulated holder of light construction. The workman holds this in his hand, strikes the arc by placing the carbon in contact with the work, and manipulates it so as to spread the arc and heat the work at and near the point to be welded with what is described as a soaking heat.

FIG. 6. ACETYLENE-WELDED WATER-JACKETED EXHAUST PIPE MADE OF STEEL 1-16 IN. THICK.

When the welding heat is attained, the work is hammered or not according to circumstances. Screens with colored glass windows are used to protect the eyes and skin of the workman from the effect of violet rays.

The Zerener Process.

The Zerener Process is an arc-welding system which was introduced by Dr. Zerener of Berlin some twenty years years ago. In this there are two carbons in the same holder, and there is a magnet which deflects the arc produced between these two carbons downward on to the work. No current passes through the work at all. There have been modifications of this system. The object is to maintain a constant voltage in the arc by having a constant length of arc. In the Benardos process the length of arc varies slightly as the workman moves the carbon nearer to or farther from the work. There is, however, in practice, no disadvantage in this.



II.—The Strohmenger-Slaughter System

The Strohmenger-Slaughter System is worked with either direct or alternating current. Alternating is, the author believes, preferred. The voltage is not very high, and its amount, within limits, not important. He has seen 85 volts used with direct, and 220 volts with alternating current, both effective. The quantity of current depends on the work.

The parts to be welded are placed in juxtaposition, and an electrode is laid upon and along the welding line. This consists of a soft iron rod covered all over, except at the extreme ends, with a flux which may be constructed chemically to suit the metal to be welded. Contact is made between the work and one end of the electrode, which fuses by a series of arcs along the welding line, melting the electrode into the work and coating the weld with a vitreous flux. It is claimed that this flux prevents oxidization. It flakes off when the metal cools. This system is interesting. The author understands that it is used with success in the welding of rails and their repair by building up worn places, but he has no experience in it beyond experimental demonstration carried out to see whether it would supersede efficiently and economically other systems in use.

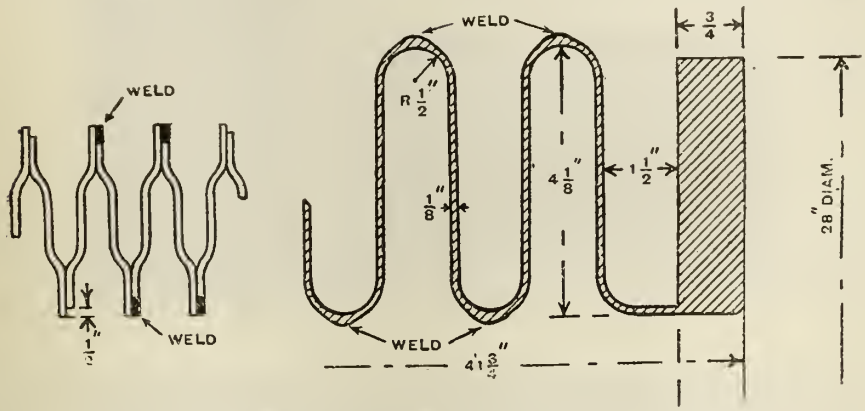
FIG. 7. ACETYLENE-WELDED NON-JACKETED EXHAUST PIPE.

FIGS. 8 AND 9. ACETYLENE-WELDED EXPANSION PIPES. SEE SECTIONS FIGS. 10 AND 11.

III.—Electric Contact Welding.

Electric contact welding is performed by machinery. The Thomson-Houston process was introduced into England about twenty years ago. With it, the pieces to be welded are fixed in a machine, one immovable and the other in a slide-rest. The piece in the movable slide is pressed by means of the screw against the other, and a very heavy alternating current, the amount depending on the area of the weld, is passed through. The electrical resistance of the joint causes a rise of temperature to welding heat, and the movable piece is pressed forward until a complete union is made. A little hammering is sometimes applied to finish the joint. This system is applied to the welding of hoops for the tyres of carts, etc., wheels, angle irons and other comparatively heavy sections, and also to wire down to small dimensions. The voltage is very low, only about 2 to 4 volts. The current per square inch is about 16,000 to 20,000 amperes.

Recent Method of Contact Welding.



A more recent method of contact welding is also performed by machinery, but in a different manner, and it is rather delicate in its adjustment as to time and current in relation one to the other. The voltage at the welding point is low, in thin work being about 6 volts, and the current, which is alternating, is also low, but the amount depends on the thickness of the pieces to be welded. In this system there are spot welding and roller welding.

In spot welding the work is laid upon a fixed copper contact-piece or electrode. When placed in position a second, movable, electrode is pressed upon it immediately above the fixed electrode. Current is then switched on, and in passing from one electrode to the other, etc., heats and welds the work. The current is sometimes cut off automatically and sometimes by hand.

In roller welding, the system is similar, except that the electrodes are rollers which grip the work overlapped between them, heating and welding it as it travels. This system requires good quality metal: it should be homogeneous, and free from scale or dirt. The adjustment of the time the metal is between the electrodes, and the amount of current required to produce the necessary welding heat and no more within that time, are somewhat difficult to estimate. It is quite a practical system, and can produce most remarkable results in good welding. The greatest care must be exercised, however, to get these results with regularity.

The spot welds are not continuous and are like a series of rivets without rivet-holes or heads. They can be made

continuous by a series of spots overlapping one another. The roller welds are continuous. The Pontelec system is spot welding and is similar to the above, but in this system a small disk is placed between the pieces to be welded immediately between the electrodes, and the disk is crushed down into the weld. It is claimed that this disk tends to concentrate the welding heat at the weld more thoroughly than with the spot

FIGS. 10 AND 11. SECTIONS OF EXPANSION PIPES SHOWN IN FIGS. 8 AND 9.

welding described in previous paragraphs. This contact welding is very economical in labor for small thin work. It requires skilful attention to keep everything properly adjusted.

Gas Welding.

The heat is produced by a mixture of gas, of more or less good calorific value, with oxygen. The gas is led from its source of supply through a flexible pipe into a burner, held in the hand of the operator, and oxygen is also led into the same burner in a similar manner. The pressure of the gas and of the oxygen is regulated with suitable apparatus. The proportion of gas and oxygen is adjusted by opening or closing their respective inlet-valves on the burner, and means are provided in the burner to prevent back-firing. The gas and oxygen issue from the burner through a small orifice at the mouthpiece, and are ignited with a match, the proportions of the two being adjusted until a clear flame shows itself in a fine point. The work is heated by this flame at the welding point, and soft iron (or other metal according to the kind of metal being welded) is melted into the joint to increase its thickness and therefore its strength.

With regard to the gas used for this class of welding, the author thinks the best is acetylene, but other gases are used in conjunction with oxygen, namely, benzol vapour, coal gas and hydrogen, the last being used more especially on the Continent of Europe. Acetylene, oxygen and coal gas can be used together. Acetylene and oxygen form as good and effective a mixture as can be desired.

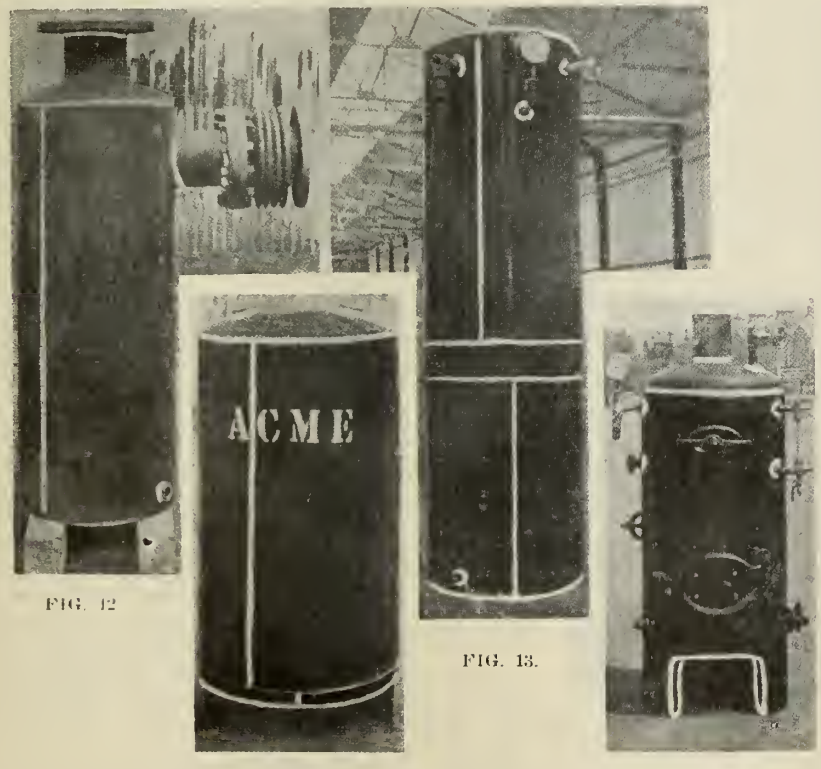


FIG. 12. FIG. 13. FIG. 14. FIG. 15.

FIG. 12. ELECTRICALLY-WELDED STEAM SEPARATOR. FIGS. 13 AND 15. RECEIVER FOR COMPRESSED AIR AND VERTICAL BOILER, WELDED PARTLY BY ELECTRIC ARC AND PARTLY BY ACETYLENE. FIG. 14. RECEIVER BODY.

Electric Arc and Oxy-Acetylene Systems.

Of the various systems referred to herein, the author regards electric arc-welding and oxy-acetylene welding as the two systems most suitable for general application, and the rest for special work. In some classes of work, the electric arc is the more suitable, and in others the oxy-acetylene system, while in some cases both systems are equally applicable. Each is more economical in its own sphere. Owing to the lower temperature, the oxy-acetylene flame is better for thin work than the electric arc, because the risk of burning the metal is not so great. The temperature of the electric arc has been calculated as about 7,500 degs. F., but will vary with amount of current. That of the oxy-acetylene flame about 6,000 degs. F. (Murray B.O. Co.).

In the author's opinion, the electric heat must be far more effective, however, because it is produced within the work itself, whereas the heat of the gas flame is applied entirely from outside. Where the work is suitable for the electric arc, welds can be made far more quickly than by the oxy-acetylene flame. The proportions of the two gases in welding vary somewhat, but should be in the neighborhood of 1.5 volumes of oxygen to 1 volume of acetylene. This proportion is given by Mr. Murray, and agrees approximately with the author's own experience in practice. The character of work done varies very largely. The electric arc is used successfully in the repair of steel castings in which, for instance, blow holes may be effectively filled up.

Both systems are used in the welding of mild-steel plates, steel barrels and drums, steel tanks of all shapes and sizes, compressed-air receivers, steam-boilers in their manufacture and in their repair, steam-piping and fittings of all sizes, angle and tee irons and other sections; the welding of bosses or flanges into vessels. Receptacles for highly inflammable and searching liquids are made in many thousands every year for petrol, bisulphide of carbon, acetone, etc., and are quite free from leakage or evaporation. The welds are capable of withstanding high pressures, indeed the author's firm have made welds in gas cylinders which have successfully withstood a pressure of 4,000 lbs. per square inch, and welds in mild-steel tube 3-16

thick by 1¼ inches diameter inside, which have withstood an hydraulic pressure of six tons on the square inch = 20 tons on the metal. They are entirely unsupported as against the pressure. It is clear that these welds must be sound and homogenous. It is necessary to point out that this is not amateur work. To weld properly and to make the joint sound throughout, skill and training are required, together with knowledge how to apply the system as well as how to design and prepare the work for being welded.

Designing Work for Welding.

In regard to designing the work for welding, there is a wide field, and one serious consideration is the avoidance of internal stresses caused by contraction. These stresses are unavoidable, but their effect may be minimized or nullified by properly designing the shape of the article to be welded. For example, a steel boss has been welded into the centre of a flat circular mild-steel plate ½ inch thick, with the result that in cooling radial cracks appeared. It is probable that the material was not the most suitable quality, but the stresses were indicated. If the same plate had been dished or curved, and of good soft quality, it would have yielded to the stresses, and would have been free from fracture or risk of it. If two plates are butted together, and a third be welded upon them, here is a stress in cooling due to the contraction forcing the butted plates together in conflict with the welds. If instead of allowing the two plates abutting to touch, a space be left between, all stress is avoided. These are examples of design which may be multiplied, and will perhaps serve to illustrate the author's meaning, as they are typical cases.

The Material Feature.

Much depends on the kind or the quality of the material, which is generally steel or iron. For the generality of this work, mild steel made by the Siemens-Martin process or wrought iron cannot be excelled, and the steel should be very soft and low in carbon to get the best results. Bessemer material is not so good, as it varies greatly in the same piece, and therefore often much internal stress exists in it to begin with.

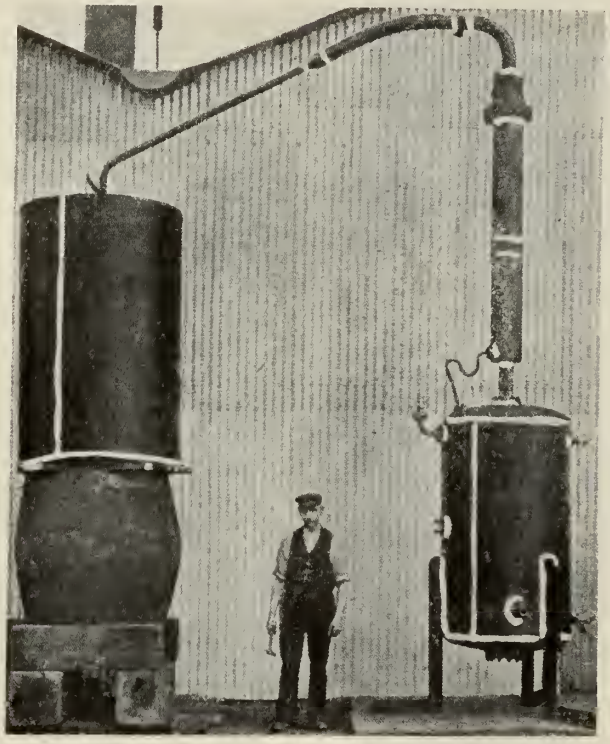

FIG. 16. STILL WITH STILL HEAD AND CONDENSER WELDED THROUGHOUT PARTLY BY ELECTRIC ARC AND PARTLY BY ACETYLENE.

The advantage of the kind of welding referred to herein is that, unlike the ordinary blacksmith's work, it is possible to be sure of a sound homogenous weld. The weld is built up from its foundation, and in most cases can be seen and its soundness and strength ensured, always provided it is properly and intelligently done.

Confidence in the Weld.

The author has heard the argument advanced that in electric or gas welding the result depends on the individuality of the workman. To a certain extent this is true, as it is true of most mechanical operations. In a weld, however, there is this difference from some other kinds of work, that a defect is not always apparent. With proper training and adequate supervision, however, and a suitable test there is no reason at all why full confidence should not be felt to a much greater extent in electric or gas welding than in blacksmith's welding. To give examples:—

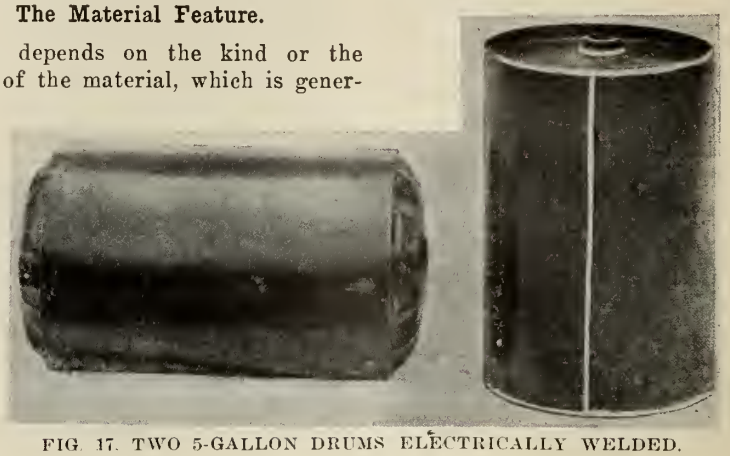

FIG. 17. TWO 5-GALLON DRUMS ELECTRICALLY WELDED.

Test Data.

A cylinder of Siemen-Martin mild steel, 20 inches internal diameter by ¼ inch thick, designed as an air-receiver for a working pressure of 100-lb. per square inch, and test pressure of 200-lb. per square inch, was submitted to a destructive test some time ago at the works of the author's firm before an engineer from the British Admiralty. The cylinder was 6 feet 9 inches long, made in two sections of length and united by a welded joint with a butt-strap welded round the cylinder. The two abutting ends of the cylinders joined were kept slightly apart to avoid internal stresses as before described. The ends were both domed outward to a radius of about 24 inches, rather too flat, but as specified, and they were ⅜-inch thick. Near one end, a handhole of oval shape without any stiffening ring was cut out of the body, and a ¼-inch cover plate put inside with central bolt and bridge piece.

At 825 lbs. pressure per square inch, this cover plate pushed through the cylinder sufficiently to split the body in the solid plate, Fig. 1. The part thus split was then cut off and the end re-welded in, somewhat shortening the cylinder, and pressure again applied,

until at 975 lbs. per square inch, one end was pushed out. This cylinder had a longitudinal weld made by the electric arc system for its full length. The two ends were flanged, inserted into the ends of the body, and welded in by the oxy-acetylene process. The method of inserting the ends is indicated by Fig. 2.

In the course of the test, the circumference of the body permanently increased 2 inches, or ⅝ inch in diameter. The electric longitudinal weld showed no sign of weakness, but became extended transversely in the circumferential direction. The buttstrap prevented the cylinder becoming stretched in its immediate neighborhood, so that the cylinder after the test appeared as if it possessed a waist. The effect of the increase in diameter was to tear the body from the ends. The stress on the metal itself just before the end came out was about 17½ tons per square inch. Another cylinder, 6½ inches diameter inside by 3-16 inch thick, made of a lap-welded boiler tube, welded by producer-gas, in the usual way of such tubes, and with ends welded in by oxy-acetylene flame, burst at 1,850 lb. per square inch at the producer-gas weld, all else remaining intact.

FIG. 18. TESTS OF 5-GALLON PETROL DRUMS. WEIGHT, 49 LBS. FULL. THICKNESS 19 S.W.G.

The author has tested steel-barrels by hydraulic pressure with ends quite flat and only 2 mm. thick by 21½ inches diameter, and they began to leak at a pressure of about 65 to 70-lb. per square inch. The flat ends pushed outward so as to tear the weld in this case, which was simply a fused weld made by the electric arc. The ends being flanged, fitted into the body, and were hooped inside and outside with light steel hoops, and the weld made by fusing the four thicknesses, body, flange of end, and two hoops together, to a depth of about 3-16 to ⅛ inch. The thickness of body was ⅛ inch, inner hoop ⅛ inch, flange of end 2 mm., and outer hoop 1-16 inch. At the author's works, there is a vertical steam-boiler working at 80-lb. per sq. inch, and all welded by the electric arc or by gas. Hundreds of boilers have been repaired by both processes, and their lives prolonged for years in consequence. All the foregoing examples go to show that these systems of welding are practical, reliable, and worthy of confidence in every respect.

Naturally, the character of the metal at the weld is changed to some extent. It loses some of its ductility, and some of its strength, but loses far less than does a blacksmith's weld. Many tests have shown that 89 to 96 per cent. of the original strength of metal can be relied on in the electric weld. It has been said, but quite wrongly, that the electric welding hardens the metal by filling it with carbon from the electrode. This is not the case. For example, in welding mild-steel the fierce heat of the electric arc burns out all the impurities, more or less, including carbon, and leaves the metal at the weld purer iron. If any hardening effect has ever been found, it has been due to bad manipulation or to the fact that the metal was never of a properly weldable quality, or the polarity was wrong.

The following tables are valuable in that they go to show the effects of the welding upon the metal:

Table I.—Chemical Analyses.

	Electrically welded.		Acetylene welded	
	Unwelded metal.	Welded joint.	Unwelded metal.	Welded joint.
	Per cent.	Per cent.	Per cent.	Per cent.
Silicon	0·009	0·003	0·009	0·002
Carbon	0·15	Trace	0·15	Trace
Sulphur	0·025	0·020	0·085	0·071
Phosphorus	0·068	0·043	0·068	0·067
Manganese	0·64	0·27	0·49	0·31
Iron (by difference)	99·108	99·664	99·198	99·520
	100·000	100·000	100·000	100·000

For these analyses, drillings were obtained from the plates themselves and also drillings from the welded joints. The plates were tested mechanically, both longitudinally and transversely along the welded joints, and, for comparison also the unwelded metal. The results of the mechanical tests of the unwelded metal are the mean of three lots.

These chemical analyses and also the mechanical tests were specially made for the author in August 1913, by Mr. F. C. Tipler, chief chemist, Locomotive Department, London and North-Western Railway, Crewe. The pieces of material were prepared at the works of the Steel Barrel Co., at Uxbridge, and were of Siemens-Martin open hearth steel, ⅛-inch thick.

Chemical and mechanical tests of acetylene and electrically-welded plates,

Table II.—Mechanical Tests on Mild Steel ⅛ in. Thick.

* Broke in weld. † Broke outside gauge length. ‡ Broke clear of weld.

received from Mr. Heaton, of the Steel Barrel Co., Ltd., Uxbridge, August 27, 1913:

One of the strips tested (Table 3) consisted of the original material, and the second one was a piece cut from the same sheet, cut into two and electrically-welded at the joint. This material was of a somewhat softer nature than that referred to in Table 2.

Examples of Electric and Acetylene Welding.

In order to show some of the applications of electric welding and of acetylene welding, some illustrations are appended. White lines on the examples indicate the welds.

Fig. 1 is a drawing of an outside butt-strap joint of the kind referred to in the descriptive notes relating to Fig. 13.

Fig. 2 represents the method the author considers best for welding an end into a vessel to resist internal pressure. The form of the end is best suited for the stresses due to the pressure, and by the system adopted, any required thickness of weld, or rather length of weld, can be made. This drawing also shows an inside butt-strap joint.

Fig. 3 is the photograph of the welded-cylinder tested to destruction, and previously described.

Fig. 4 shows a piece of work fixed on an anvil and in process of being welded by the electric arc. The resistance coils for adjusting the current are

Table III.—Mechanical Tests on Two Strips of Siemens-Martin Mild Steel Sheet ⅛ in. Thick.

—	Breadth of Testpiece.	Thickness.	Area.	Maximum Load.		Extension on 4 in. Length.	Reduction of Area.	Remarks.
				On Piece.	Per Square Inch.			
	Inch.	Inch.	Square inch.	Tons.	Tons.	Per cent.	Per cent.	
1	1·480	⅛	0·185	4·06	21·95	32·08	29·63	Original

clearly shown, also the carbon holder and the hand screen used by the welder. This kind of joint is made by abutting the two parts, and is thickened by adding pieces of scrap of the same material. The electric arc heats the metal, and as soon as the proper degree of heat is attained, the welder puts down his carbon, uses the swage shown in the illustration, and the striker hammers it, and so toughens the weld.

Fig. 5 shows a mild-steel water-jacketed exhaust pipe being welded by acetylene and oxygen. This is a flash-light photograph, and the welding flame is clearly shown. Three types of burner are shown in this illustration. That nearest the welder is a Fouché burner, while the middle one is the type of burner recommended by the British Oxygen Co. For different thicknesses of work it is necessary with both these types to have different sizes of burners. The third burner shown is made by a firm in Brussels. It is of copper tube and is flexible. This burner is supplied with various sizes of nozzles, and of adjusting pieces, so that the same burner can be adjusted to suit a large range of thickness.

Fig. 6 shows a water-jacketed exhaust pipe made of steel sheet 1-16-inch thick, with six exhaust branches, and with an inlet and outlet for water circulation. The length is 4 feet, and the weight 28 lbs. It was for a racing boat, and was acetylene welded.

Fig. 7 shows another exhaust pipe not jacketed, for a motor-car, also acetylene welded. This is very light compared with the ordinary cast-iron pipe in the place of which it was required.

Fig. 8 represents an expansion pipe in mild-steel welded by acetylene. It was designed to go between a steam-turbine and its condenser, and had an internal diameter of 4 feet 6 inches. The form is similar to that of a concertina, being made in circular sections, ⅛ inch thick, welded together along their inner and outer peripheries. The flanges were also welded on, these being ½ inch thick.

Fig. 9 is an expansion pipe of somewhat different form, 18 inches diameter.

Fig. 12 shows a steam separator, having the longitudinal joint of the body electrically welded. The rest of the welds were made by acetylene. The diameter of separator was 18 inches; length of body 4 feet; thickness ¼ inch; inlet pipe 7 inches, with flange 14 inches diameter by 1⅛ inches thick; and outlet pipe 6 inches diameter. The boss for drain-pipe connection at bottom of the body was welded in electrically.

Fig. 13 shows a receiver for compressed air, 10 feet high by 3 feet diameter. This was welded partly by the electric arc and partly by acetylene. The butt-strap welded round the body may be noted. It is to connect the two sections together. The working pressure of the receiver is 100 lbs. per square inch.

Fig. 14 is a smaller receiver body, ⅛-inch thick, with ends 3-16-inch; test pressure, 300 lbs.; diameter, 16⅝ inches, and length, 2 feet 6 inches.

Fig. 15 represents a vertical steam-boiler, welded partly by the electric arc and partly by acetylene, for a working pressure 80 lbs. per square inch.

Fig. 16 shows a still for distilling benzine, with still-head and condenser welded throughout partly by the electric arc and partly by acetylene. The feet are of T section welded on the still.

Fig. 17 represents two 5-gallon electrically-welded drums made by contact welding. One was tested by hydraulic pressure to 90 lbs. per square inch before any leak showed itself. The diameter is 12 inches inside, and the thickness of steel sheet 20 B.G = 0.996 mm. Under pressure the permanent set of the ends is clearly shown.

Fig. 18 is an exactly similar drum to Fig. 17. The photograph shows two views. This drum having in it 5 gallons of petrol was dropped seven times, starting from 3 feet and including two falls on solid iron, one 8 feet 6 inches and one 15 feet, and a final fall of 19 feet on to a macadam road. There was neither fracture nor leakage.

G.T.R. "SAFETY FIRST" MOVEMENT.

THE SECOND monthly meeting of the General Safety Committee of the Grand Trunk Railway System was held on Monday, February 23, in the room of the Board of Directors at the General Office Building in Montreal. Howard C. Kelley, vice-president, presided, and there also attended, U. E. Gillen, general superintendent, Chicago, Ill.; H. E. Whittenberger, general superintendent, Toronto; H. R. Safford, chief engineer, Montreal; T. W. R. McRae, chief claims agent, Montreal, and George Bradshaw, safety engineer, Montreal.

Reports received from twenty-three Safety Committees, located at various points on the system showed that during January last, members of the Safety Committees corrected 445 unsafe physical conditions and cautioned employees against unsafe practices in 433 cases. The report of the secretary showed that the influence of the safety movement is being felt in a constant reduction of injuries to employees and patrons, the results for January being more favorable than for any previous month, notwithstanding the severe weather, which often is an indirect cause of casualties.

SMOKEBOX CINDERS AS FUEL.

IN THE ZEITSCHR. des Ver. Deutsch. Ingen., recently, Mr. O. Nerger emphasizes the importance of utilizing locomotive cinders for heating purposes, and describes the various plans put forward up to the present to do so. Experiments with chain grates and other mechanical methods of stoking have not been entirely successful. The management of the Royal Breslau Railway Co., which is building a new head workshop at Oels, has recently engaged in exhaustive researches on this subject. At the suggestion of Mr. Cohn, the Government engineer, these researches were extended to the forced draught traveling grate Pluto stoker, because it had already been found possible with this device to burn up profitably coke cinders, anthracite dust, and other non-gasing fuels of that nature.

Its chief element consists of a hollow grate piece which is movable to and fro, and is provided with slots on its inner or heated surface. Compressed air enters the furnace through these slots, pre-heating the air, and preventing any lowering of the general temperature of the furnace. In earlier trials, the cinders showed a tendency to cake together in spite of the motion of the hollow grate, and so their passage over the slots was impeded. The caking of the cinders also stopped up the slots and hindered the entrance of air. Thus the cinders were not completely consumed and a considerable proportion of unburned materials was found in the residues.

A number of slight modifications, such as regulating the speed and throw of the grates and the pressure of the air, remedied these defects, but the chief improvement consisted in introducing steam into the hollow grate bars as it loosened the clinkers and allowed the air to have free access to the furnace. The success of the arrangement is due to the continual loosening of the fuel by the to-and-fro motion of the bars, thus giving the air of combustion access to all parts of the fuel.

Flywheel Query.—H. Westwood, Stratford, Ont., has sent in the following problem for solution by readers:—A flywheel 12 ft. in diameter, and weighing 10 tons, revolves at a speed of 150 r.p.m. It is built in halves, these being secured by four 2½ in. bolts at the hub, and by four 2-in. bolts at the rim. If there is a tensile strain of 1,000 pounds on each of the hub bolts and 700 pounds on each of the rim bolts when the engine is standing, how much strain is there on the respective bolts when the engine is running at normal speed?

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

TENSION ON CYLINDER COVER STUDS.

By A. E. W.

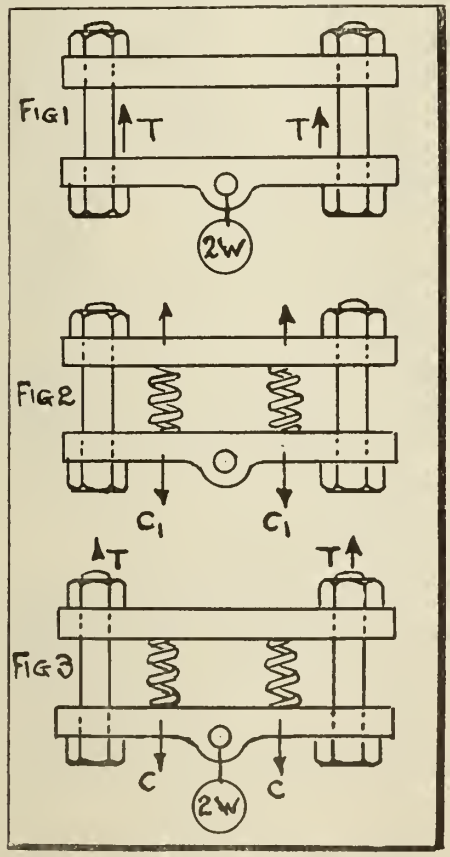
SINCE sending in my first contribution on this interesting subject for the Feb. 19 issue, I have come across a solution by a well-known expert, whose conclusions will doubtless be of interest to my fellow-readers. The authority referred to is Professor Unwin, whose "Elements of Machine Design," is a widely used text-book on the subject. Doubtless many readers are familiar with the book; and if they will turn to page 182 of Volume I., they will find the matter gone into very fully. For the benefit of those who do not know the book, I have here extracted part of the chapter dealing with bolts and nuts, and have made a copy of the sketches accompanying the section.

Straining Action on Bolts.

Professor Unwin says:—"Suppose a plate be suspended by two bolts, and a load (2W) hung midway from it (Fig. 1). The tension on each bolt will be T =W, and the case presents no ambiguity. Commonly, however, the plates which are themselves to some extent elastic, are screwed tightly together, with a more or less compressible packing between them, and there is an initial tension in each bolt before the load is applied. This tension is balanced by the elastic reaction of the pieces fastened together. The case may be diagrammatically represented by imagining the plates rigid and elastic springs interposed, Fig. 2. Then the arrangement being symmetrical, each bolt has initially a tension, ($T=C_1$), due to the compression of the springs by screwing up. Let a load (2W) be now applied, Fig. 3. The tension in the bolts will increase, they will stretch and so diminish the compression of the springs, and the tension in the bolts will have same value between (W) and ($W+C_1$), depending on the relative elasticity of the bolts and springs.

"If (W) be increased till the stretch of the bolts is equal to the initial compression of the springs, (C) vanishes, and, for this or any greater load, the tension in each bolt will be ($T=W$), as in Fig. 1. In most practical cases, however, the initial tension due to screwing up must be sufficient to prevent this, or there would be a sensible separation of the connected pieces.

"Let the extension of the bolts be (A) and the compression of the springs (B) per unit of load, then initially the compression of the springs is (BC_1). When the load is applied, the bolts stretch an amount A ($T-C_1$), and the compression of the springs is equally diminished. Then,



$$BC=BC_1-A\ (T-C_1)$$

$$C=C_1-\frac{A}{B}\ (T-C_1)$$

$$T = W + C = W + C_1 - \frac{A}{B}\ (T-C_1)$$

$$= \frac{B}{B+A}\ W + C_1$$

"If the springs are very rigid compared with the bolts, as when the bolts connect two strong flanges, (B) is small compared with (A), and then ($T=C_1$), or the initial stress due to screwing up **is not increased by adding the load.**

TENSION ON CYLINDER COVER STUDS.

"If the extension of the bolts be equal to the compression of the springs per unit load, ($B=A$), and then ($T=\frac{1}{2}W + C_1$), and this case might occur when there is elastic packing to make a tight joint between strong flanges.

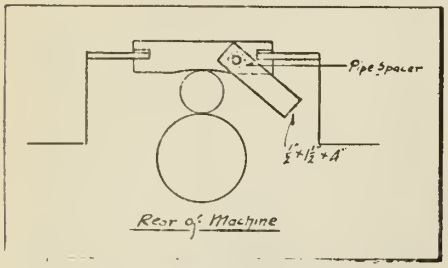
"Lastly, if the extension of the bolts be small compared with the compression of the springs ($T = W + C_1$)

"In the more ordinary cases, therefore, the load on the bolt depends chiefly on the strain put on initially in screwing up. Since workmen may exert considerable force in screwing up bolts, the strength of the latter must often be much more than would be necessary if the load only were considered."

From the above it will be noted that Professor Unwin states that the load does not increase the initial tension in the bolts when the heavy flanges are bolted together, as in the case of a cylinder cover **metal-to-metal joint.** Of course the stress in the bolts would be increased if the load exceeded the initial tension, but in such a case the joint would not remain tight.

Where an elastic packing is inserted in the joint, the load **does** increase the initial tension in the bolts, so that the two rules quoted in my first contribution would seem to hold good.

Discussions on subjects of this nature are certainly very interesting, as is clearly evidenced by the number of readers who are taking part in this one. I hope we shall have more of them.



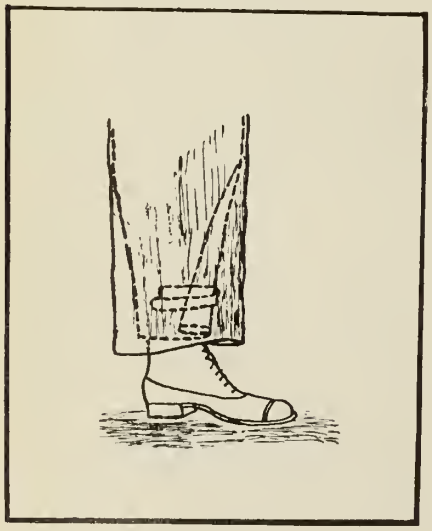
MILLING MACHINE KINK.

By D. A. Hampson.

WE had about twenty-five milling machines going all the time at capacity; about half of them were Lincoln type, and, like so many Lincolns the table feed was short, so short for the work that an inch or two was all the travel we could allow for loading, beyond the actual cut. Quite naturally the boys would give themselves a little more room away from the cutter and as a consequence somebody ran the nut off the screw every hour of the day, when the table was shoved on the nut got a bang which didn't help the last thread any. Moving the table with the nut only half engaged as it was with the short clearance at the end, was bad enough. These two causes and the foreing of cuts through steel wore the nuts out rapidly. Now, babbitting one of these nuts and getting it a good fit and getting it perfectly aligned is no cinch. Everyone who has tried knows that

We decided that prevention was better than cure For that end machine was supplied with a positive stop to prevent the nut from being run out; the stop be-

ing applied at the rear where it was least apt to be meddled with, and set, not adjustable, so that at the limit the screw engaged the full nut length. The stops consisted simply of a ½ in. or 1½ in. stop secured to the rear end of the



PREVENTING MILLER TABLES BEING RUN OUT.

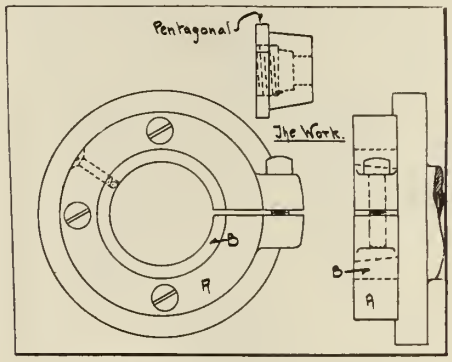
table by a heavy bolt. A pipe spacer, faced to the right length for each particular machine, offset the stop when the table had to be moved beyond the rear of the saddle. In loading position, the work was then nearer the cutters, and cutter guards were supplied so that the operators could work expeditiously and in safety.

KINK FOR PUTTING ON OVERALLS

By James E. Cooley.

EVERY workman knows that each time when putting on a pair of overalls the legs of the trousers become drawn up and have to be pulled down and smoothed out, as they feel uncomfortable when humped-up. A useful kink to prevent this, and shown in the

KINK FOR PUTTING ON OVERALLS.



illustration, is to fold the trouser-leg about the ankle and fasten with a bicycle-clip. The overalls will then slip on easy. The clip should be left on, as it prevents dust and dirt from getting up inside the trouser-leg

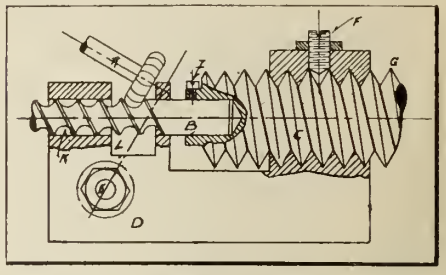
FIXTURE FOR TAPERED WORK.

By D. A. Hampson.

ONE of the jobs that reappeared from time to time was the boring and threading of cast iron pieces such as shown in the drawing. They came to us turned on the outside and with the small hole drilled Our work was to drill or bore out the larger hole (tapered) or to cut the internal thread. The reason for this division of labor between two shops was not apparent and we did not question it; every month from one to four dozen would come in to be threaded and bored. The tapered end made the pieces hard to hold securely and true. Special sizes were in use and it was decided to make a simple fixture that would accommodate itself to all sizes and to the taper.

A casting (A) was made up, faced and bored, with a central hole larger than any of the work pieces. This casting was bored out after screwing to a face plate which was prepared for same by

FIXTURE FOR TAPERED WORK.



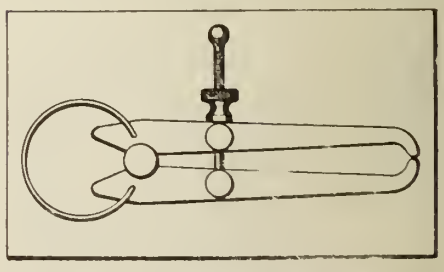
turning out 1-16 inch deep as shown. A saw cut and a binding bolt completed piece (A). To adapt the casting to the work pieces, cast iron sleeves, straight on the outside and of the proper taper on the inside were made for each of the various sizes. These sleeves were split and are shown at (B).

In operation, the parts were assembled on the lathe. The work was put in the proper sleeve and the screw tightened. By this method, the pieces were "chucked" quickly and firmly. The fixture was cheap and easily adapted to the different sizes; it held without slippage on the tapered (3½ deg.) surface.

SPIRAL MILLING ON THE LATHE.

By H. Womersley.

THE great range of work that can be done on the engine lathe is not fully appreciated. The accompanying sketch shows a very useful arrangement for spiral turning. The cutter (A) is held on the lathe spindle, and (B) is the work-piece, which in this case is a rod in which a long spiral groove has to be milled. The holder or chuck (C) of the work-piece (B) is such as to enable a great number of pieces to be made at low cost. The permanent attachment (C) has a thread (G) which serves as a guide, and has the same pitch as the required grooves on (B). The casting



SPIRAL MILLING ON THE LATHE.

(D) is fastened on the lathe by the bolt (E), which holds it fast on the tool-post plate. After the attachment is brought to the proper angle to give the tool (A) the right pitch, the entire apparatus can be given a to-and-fro movement by means of the cross feed. The opening (K) in the casting (D) is exactly the same diameter as the rod to be milled, and as a consequence supports the latter. The opening (L) permits entrance of the cutter. By turning (C) with the hand the work-piece is fed forward.

SPECIAL OUTSIDE CALIPERS.

By D. A. Hampson.

A HANDY caliper—one that every machinist should have—is that here illustrated. It is an "outside" spring caliper with straight legs and short points The writer has made a number of them from inside spring calipers by disassembling, filing notches on the opposite sides of the legs for the spring and the centre stud, and reassembling in reverse of their original position. A four-inch caliper is large enough for most of the work required of such a tool, and such a one converted would represent an outlay of about seventy-five cents and perhaps a half-hour's

SPECIAL OUTSIDE CALIPERS.

work. Many a time such a tool is worth twice that to a man who finds he has no tool in his kit that can be used for some certain job.

The uses of this caliper are many. For inspection purposes, it is particu-

larly adapted. Assume that a small hole is to be drilled centrally in some rectangular blocks. How can its true location be determined? The anvil of a micrometer will not enter the hole. Outside calipers cannot be used—the big-bowed legs not permitting, while rivet joint inside calipers are too slow and too uncertain. The calipers shown are ideal for the task—sensitive, quickly changed and small enough ends to enter the hole so that any mechanic worthy of the name can detect a difference of .0015 in. between two measurements with them. On the planer and shaper they are very handy to measure the thickness of work being planed which is held in a vise or on parallels, but in such confined space (vertically) that bow calipers are out of the question.

CANADIAN SHIPBUILDING WANTS GOVERNMENT AID.

A DEPUTATION representing the shipbuilding industry waited upon Premier Borden and members of the Cabinet on March 4 and urged Government co-operation in the development of shipbuilding in Canada. The following were included in the deputation:—Thomas Long, Toronto; Capt. McDonald and R. B. Wallace, of Port Arthur; J. Sword, of Kingston; P. L. Miller, of the Canadian Vickers, Montreal; J. B. Miller, of Toronto; Thomas Hall, of Montreal, and George Davie, of Quebec.

It was urged by the members of the deputation that as the plant of the companies represented a heavy investment, every effort should be made by the Government to throw business their way. In recent years, it was pointed out, the Government had placed orders for dredges, etc., outside of Canada. It was urged that in the future the Government place all such orders with Canadian firms.

Some objection was also taken to the fact that the Government, though professing to encourage Canadian shipbuilding on the part of others, had gone into the business itself, and in many cases had vessels built at the Sorel shipyards. Some of the members believed that the Government should not be in the business now that the industry had become pretty firmly established.

Northern Electric Co., Ltd.—The recently incorporated Northern Electric Co., Ltd., has taken over the Northern Electric & Mfg. Co. and Imperial Wire & Cable Co. The business previously carried on by the two latter concerns will be conducted by the newly-organized company without change in management.

QUEBEC MINERAL PRODUCTION.

A STATEMENT of the mineral production of the province of Quebec for the year endng December 31st, 1913, as prepared by Mr. Thee C. Denis, superintendent of mines, shows that the value of the products of the mineral industry of the province of Quebec in 1913 totalled $12,918,109. The mineral production for 1913 is the highest yet recorded. For the last ten years there has been an unbroken series of increases of each year over the preceding one, the value of the output having been quadrupled in the decade.

The table of production in the province of Quebec for the year ending Dec. 31st, 1913, is as follows:—

Substance.	Value.
Asbestos	$3,825,959
Asbestic	20,245
Copper and sulphur ore	866,774
Feldspar	1,554
Gold	14,794
Graphite	9,620
Iron ore bog	.....
Iron ore titaniferous	9,824
Kaolin china clay	4,354
Mica	117,038
Mineral water	31,728
Ochre	40,868
Phosphate	3,506
Quartz and phonolith	2,363
Silver	21,791
Zinc and lead ores	7,379
Structural Materals—	
Brick (M)	1,272,092
Cement	3,361,292
Flagstone	.....
Granite	482,338
Marble	120,541
Lime	452,330
Limestone	1,570,455
Sand	343,750
Sandstone	5,072
Slate	6,286
Tile, dray and sewer pipe pottery, etc.	326,165
Total	$12,918,109

Asbestos Market.

There has been a marked improvement in the asbestos market, although the conditions are not yet ideal. The working margin of profits in the asbestos industry is narrow.

Except for the very appreciable increase in the shipments of copper and sulphur ore, there are no new developments in the industry. The value of the copper and sulphur contents of these ores amounted to $866,774 in 1913. This is an increase of $234,811 as compared with 1912.

The iron ore and iron smelting industry has been dormant in the province for over two years. There has been no production recorded since 1911, and the prospect for a resumption of activity is not of the brightest.

The titaniferous iron ore recorded comes from Sturbain and from Ivry. It is used as an ore of titanium, of which element it contains from 18 to 30 per cent.

The figures of gold and silver represent the contents of these metals in the copper and sulphur ores of the Eastern townships. The Beauce placers were not operated during 1913.

The results in the graphite industry have been very disappointing. The mills of the Dominion Graphite Co., the largest producers in 1912, did not reopen. Most of the other graphite plants report greatly reduced operations, with the exception of the Quebec Graphite Co., at Buckingham, which worked actively throughout the year, but mostly on experimental work.

Although the production of china clay is yet very small, the outlook is promising. The Canadian China Clay Co., working a deposit in Amherst township, Labelle County, have put in an experimental washing plant.

The whole of the output of Kaolin is sold to paper manufacturers, who use it as a filler.

Structural Materials.

Notwithstanding the general trade depression which prevailed during the year, it is gratifying to see that the production of structural materials more than held its own as compared with 1912. The figures for cement, limestone, granite, and brick show increases. This indicates that, despite adverse conditions, the general development of the province of Quebec was not in any way retarded, for the production of structural materials is a very good criterion of such progress.

During the session of the Quebec Legislature which has just closed, an amendment to the Quebec mining law was passed, reducing the price of mining concessions, from $20 and $10 an acre (according to distance from railway), to a uniform price of $5 an acre.

In 1913, according to returns received, 8,996 men found employment in the mines, quarries, clay pits, and ore mills in the province of Quebec. The total wages paid amounted to $5,179,395. A certain proportion of these men were employed for part of the year only, but the majority worked 300 days.

During 1913 there were 15 fatal accidents. Of these, ten occurred in the asbestos mines, four in quarries, and one in a copper mine.

The Babcock & Wilcox Co., Ltd., Toronto, have received an order for four 300 h.p. boilers from the Canadian Kodak Co. for their new factory at Mount Dennis, Ont. They are also supplying a 150 h.p. boiler to the Moose Mountain Mines at Fellwood, Ont.

SUPERHEATING STEAM IN LOCOMOTIVES.*

By Henry Fowler.

THE utilization of steam superheated, or of a higher temperature than saturated, has engaged the attention of engineers since the inception of the use of the expansive power of steam, i.e., since the middle of the eighteenth century. Its application in locomotives was suggested over 85 years ago, and for half a century many attempts were made to employ it in this class of engine. Owing to trouble arising from the packing and the lubrication, these were not successful, and the prominent position it occupies at the present day is very largely due to the investigatious of Dr. Wilhelm Schmidt, of Cassel, and to the practical trials of his apparatus made by Mr. R. Garbe, of tthe Prussian State Railways. Various types of superheaters were tried, but the one now in most general use is that in which the steam receives its superheat when passing through small tubes placed in large smoke tubes through which the heated gases travel on their way from the firebox to the chimney. This type is general in England, where, in addition to the Schmidt system, the Swindon and Robinson systems, which differ from the Schmidt in detail only, are also employed. The utilization of the heat in smoke-box gases has been tried repeatedly, but without much practical success.

Under ordinary conditions, when an engine is running, the steam passing through the superheating elements carries away with it sufficient heat to keep the metal of the elements comparatively cool. When, however, a locomotive is running down an incline without steam, this does not occur, and it is necessary to prevent the gases from passing through the fire-tubes, which is effected by a damper or some other type of retarded. Arrangements are generally made for working the dampers or retarders automatically. The connection between the superheater elements and the header from which steam is distributed is a matter of importance, and the methods by which this is done constitute one of the chief differences between the various fire-tube superheaters. Essentially, however, they consist of those in which a joint is made between the pipe and the collector, and those in which the former is expanded into the latter.

Provision Against Trouble.

Piston-valves are employed almost exclusively in locomotives using superheated steam. These have to be of special design, owing to the greater fluidity of superheated steam and to the difficulty of efficiently lubricating any surface to which highly superheated steam has access and which has a heavily loaded machine-part passing over it. For the same reasons special attention has to be paid to the design of the piston-head. The high temperature of the steam necessitates glands of special design wherever they are required, as well as arrangements for cooling the glands by allowing access of air where possible. The packing used requires to be of special high-melting composition, and here, as elsewhere, it is necessary to design the parts so that as little pressure as possible exists between two surfaces which are exposed to the temperature of the highly-superheated steam. The oil used for lubrication is generally a mineral oil which has a high flash-point and which is fed into the various parts by a mechanical lubricator which will ensure a definite, determined amount of the lubricant being delivered regularly at the necessary points. The provision of a pyrometer which allows the engine-driver to know at what degree of superheat he is working is advisable. Owing to the use of piston-valves which do not permit the relief of compression or suction in the cylinders when running with the regulator shut, it is necessary to provide by-pass and vacuum relief valves. Some of these valves are also suitable for dealing with any water which may be carried over into the cylinders, whilst in other cases special relief valves are fitted. The large tubes in which the superheater elements are placed give little trouble.

The greater volume of superheated steam, when compared with saturated, has in many cases led to the adoption of larger cylinders and lower boiler-pressure. This leads to economy in boiler-repairs, which should counterbalance the increase of maintenance necessary for the extra apparatus required when superheated steam is used. The degree of superheat usually employed is 230 degrees to 260 degrees F. No figures at present seem to be available for the variation in the economy with varying degrees of superheat.

Chief Advantage.

The chief advantage claimed for the use of superheated steam in locomotives is the economy in coal-consumption, and on the Midland Railway, a number of trials have been made to ascertain what this is with the various types of engines, the comparison being made on the consumption per ton-mile under circumstances as nearly comparable as possible. These trials show that a saving of 23 per cent. in the coal consumption and of 22 per cent. in the quantity of water used, was obtained in one case, whilst in another, where the difference between the locomotives was solely in the superheater, the saving of coal was as high as 30 per cent. This high figure was probably due to the engine which used superheated steam having more reserve of power than the one employing saturated steam. From diagrams of these two engines it can be shown very clearly how much more fluid superheated steam is than saturated.

Experiments have been carried out to ascertain the effect of superheating the steam supplied to the high-pressure cylinder of a three-cylinder compound locomotive, and it has been found that a saving of coal of 25.9 per cent. and of water of 22.3 per cent. has resulted when comparison is made with a similar engine using saturated steam. In tests carried out with goods-engines, the coal-saving has been from 14.3 per cent. to 18 per cent.

*From a paper read recently before the Institution of Civil Engineers.

READER, WHAT DO YOU KNOW?

Among readers of Canadian Machinery there is a clearly defined sincerity of desire to know how each overcomes the daily tasks of the machine, pattern and blacksmith shops, the foundry and boiler shops. It is believed that your methods and devices, while good, may be improved, and thereby made more valuable if you publish them, so that other brains may work on them. We will provide the setting and pay you for the material. When your fellow tradesman puts the superstructure on your foundation, we pay him and pass the "kink" on to you, free. Get into the game.

The Canadian Stewart Co., Ltd., Toronto, have ordered a derrick scow from the Polson Ironworks. The vessel will be 120 ft. long, beam 42 ft., and 9 ft. deep.

Canadian Allis-Chalmers, Ltd., Toronto, have been appointed exclusive agents for Canada and Newfoundland of the Avery Automatic Scales. The parent factory, at Birmingham, England, was established almost 200 years ago, and is, without doubt, the oldest and largest scale concern in the world, comprising factories in England employing 5,000, and another at North Milwaukee, Wis. The Avery scale in the Canadian Government elevator at Port Colborne, Ont., constitutes the largest installation and the largest automatic grain scale in the world.

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Attention is drawn to the alternating course in arithmetic, a concurrent study of which is recommended with that of the Question and Answer Series.

Question.—A railway train starting from rest along a level piece of track acquires a speed of 30 miles per hour in five minutes. What has been the **mean pull between the locomotive and the train**, if the resistance to motion is 10 lbs. per ton and the train weighs 225 tons. Take a ton as meaning 2,240 lbs.

Answer.—The constant pull due to resistances=10×225=2,250 lbs.

Mass of train=m=$\frac{225\times2240}{32}$=15,750.

Velocity of train=v=30 m.p.h.=$\frac{30\times5280}{60\times60}$=44 ft. per second.

Momentum of train=m×v=15750×44, and time taken to produce this momentum=5×60=300 seconds, therefore the main pull producing change of motion is $\frac{15750\times44}{300}$=2,310 lbs., and the total mean pull between the engine and train is 2250+2310=4650 lbs.

* * *

Question.—A screw jack has a screw of ½-inch pitch. If a force of 50 lbs. be applied at the end of a 36-inch lever and the efficiency of the jack is 40 per cent., what weight can be raised by it?

Answer.—Neglecting friction, the power put into the mechanism is equal to the power given out by it. That is to say, the force applied at the end of the lever multiplied by the circumference it describes in one revolution is equal to the pitch of the screw multiplied by the weight raised. In the present case, the efficiency is only 40 per cent., the other 60 per cent. being lost in friction. The weight actually raised by the jack will, therefore, be .40 of the weight theoretically raised. Calling the latter W lbs., we have

W×½ in.=70×2×36×3.1416X.40.

$\frac{W}{2}$=633.35.

W=1266.7 lbs.

* * *

Question.—What is the distinction between **energy** and **power?**

Answer.—Energy is the capability of doing work which a body may possess by reason of its position, condition, or motion. It is of two kinds. Thus, there is **potential energy**, or that form of energy which a body possesses in virtue of its position or condition. For instance, when a pile driver drop weighing 50 lbs. has been raised 20 feet it has a potential energy of 1,000 ft. lbs.; for it takes that amount of work to lift the 20 lbs. through 20 feet; and, if then allowed to fall, the drop will naturally give out the same amount of work. An example of potential energy due to the condition of a body is found in the coil spring of a watch or clock.

The energy due to the motion of a body is called **kinetic energy.** For instance, in the first example cited above, the pile driver drop weighing 50 lbs., in falling freely through 20 feet, had stored up in it, due to its motion, an amount of work equivalent to 1,000 ft. lbs.

Power is the **rate** of doing work, or the work done in a given time. The unit of power in this country is the horsepower and is the rate of doing work, equivalent to 33,000 ft. lbs. per minute.

* * *

Question.—In a wheel and axle the radius (R) of the wheel is 20 in.; the radius (r) of the barrel is 4 in.; and the weight to be lifted is 300 lbs. Find the force (P) to be applied?

Answer.—P $\frac{300\times4}{20}$=60 lbs.

* * *

Question. — The crank or handle which turns a windlass is 14 in. long. What must be the diameter of the axle when a man exerting a force of 60 lbs. upon the handle raises a weight of 2 cwts.?

Answer.— $\frac{14\times2\times60}{112\times2}$=7½ in.

* * *

Question. — What weight may be raised by a block and tackle with three sheaves in each block, when the force (P) applied is 30 lbs.?

Answer. — W = 30 × 6 = 180 lbs.

* * *

Question.—The two blocks (A) and (B) of a block and tackle weight 25 lbs. each, and the weight (W) is 200 lbs. The whole is held in equilibrium by a certain force (P) applied at the fall of the cord. What will be the pressure on the hook which supports the blocks?

Answer. — The total load to be raised = 200 + weight of bottom block = 200 + 25 = 225 lbs. There are six cords, therefore, P = 225 = 37½ lbs.

6

The total load suspended on hook will consequently equal 200 + 25 + 25 + 37½ = 287.5 lbs.

* * *

Question. — The upper block of a rope and pulley lifting tackle has three pulleys, and the lower block has two pulleys. What force (P) in lbs. applied to the fall, will lift a weight of 4 cwt.?

Answer.—P = $\frac{4\times112}{5}$ = 80 3/5 lbs.

* * *

Question. — In a Weston's pulley block, the effective radii of the compound pulleys (i.e., from the centre of pulley to the centre of chain which passes round it) are 4 in. and 3½ in. respectively. Find what weight (W) can be lifted by a force of 20 lbs. (neglecting friction).

Answer.—

W = $\frac{2\times20\times4}{(4-3\frac{1}{2})}$ = $\frac{160}{.5}$ = 320 lbs.

* * *

Question.—The base of an inclined plane is 20 feet long, and the height 6 feet. Find the length (L) of the incline?

Answer.—L = 202 × 62= 20.88 feet.

* * *

Question.—The base of an inclined plane is 20 feet long and 6 feet high. What force (P) acting parallel to the plane will pull up a body weighing 300 lbs., when the co-efficient of friction between the body and the plane is .25?

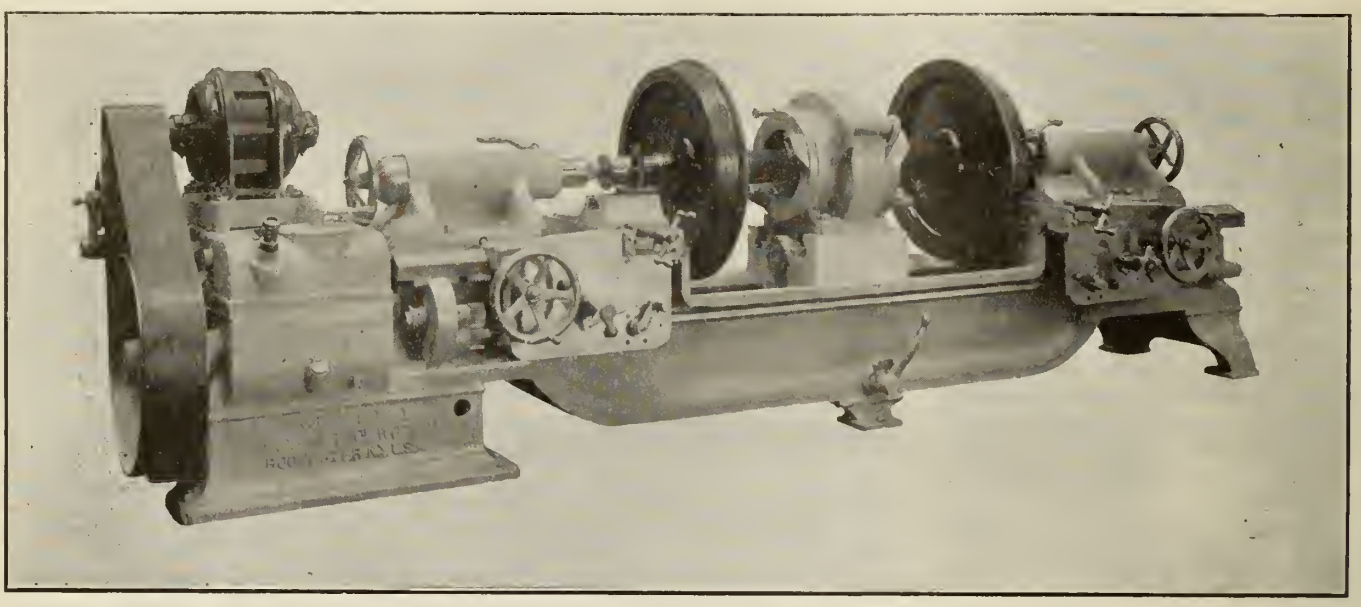
Answer. — Worw due to gravity = 300 × 6 = 1800 lbs. Work due to friction = 300 × .25 = 1500 ft. lbs. Total work = 1800 + 1500 =3300 ft. lbs. The length of incline is 20.88 feet, as above, therefore,

P = $\frac{3300}{20.88}$ = 158.04 lbs.

* * *

Question.—A train of wagons weighing 80 tons is supported on an inclined plane rising one foot for every 60 feet of length, by a wire rope attached to a stationary winding engine. Find the tension on the rope?

Answer.—

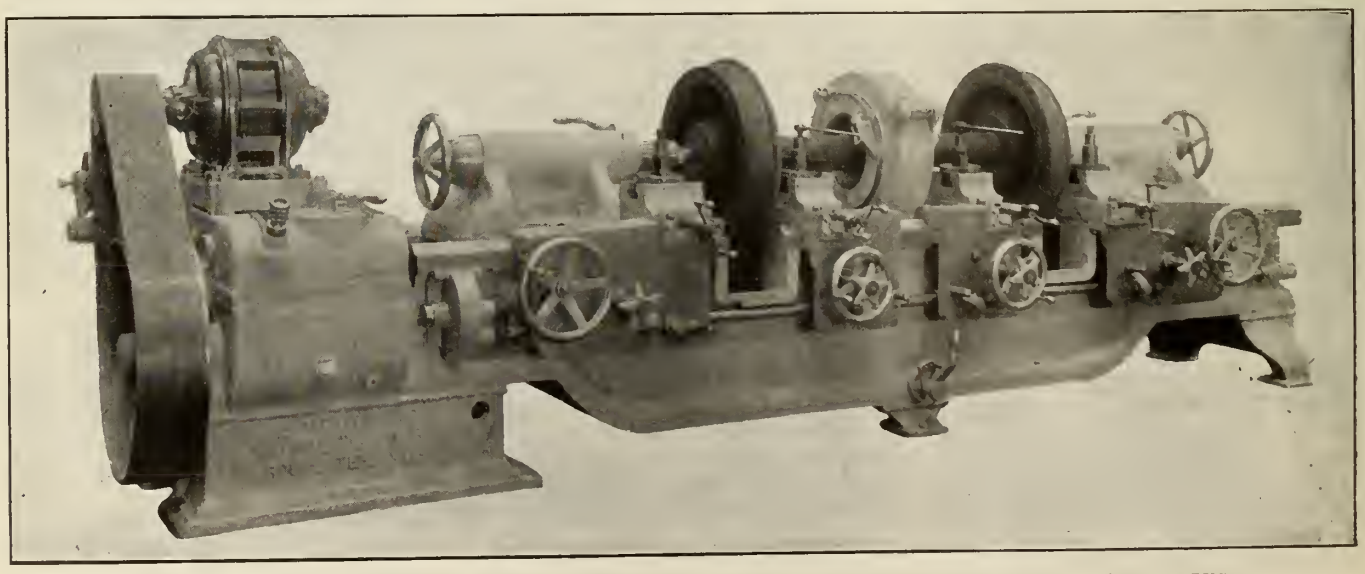


Tension = $\frac{80\times2240\times1}{60}$ = 2986.6 lbs.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

"BRIDGEFORD" CENTRE DRIVE GAP AXLE LATHE.



THE illustration shows a centre drive gap axle lathe with two carriages, a machine especially designed for use in railroad shops where it is desired to turn the journals of car axles without removing the wheels, thereby saving considerable time and expense. As the machine is equipped with two carriages, both ends of the axle may be refinished at the same time. The construction is similar to the Bridgeford regular line of axle lathes. It is usual for this machine to be placed in a pit so that the axles with the wheels attached can be placed on the centres with little trouble.

"BRIDGEFORD" CENTRE DRIVE GAP AXLE LATHE.

The driving head is powerful and of heavy construction. The driving gear, two pitch, 5-in. face, is entirely encased and runs in heavy bronze bearings scraped to fit, and is furnished with drivers for driving the axle. These operate on the same principle as the self-centering steel driver furnished with the Bridgeford regular axle lathes. The driving gear is in two pieces, of tongue and groove construction, bolted together by four heavy hinge bolts and nuts, easily operated by means of a large socket wrench. Less than one-half turn of each nut is all that is necessary to release the gear so that it may be opened to allow the entrance of the wheels and axle. The upper half of the driving head operates on a heavy hinge stud placed in front of the machine. To lift, the pull pin is pushed in place and the nuts are released. An eye bolt is placed on the upper half of the head and to this can be attached a rope with weights operating through sheave wheels to lift and lower the head.

Power is applied to a constant speed pulley. There are three variations in

"BRIDGEFORD" CENTRE DRIVE GAP AXLE LATHE WITH EXTRA INSIDE CARRIAGES.

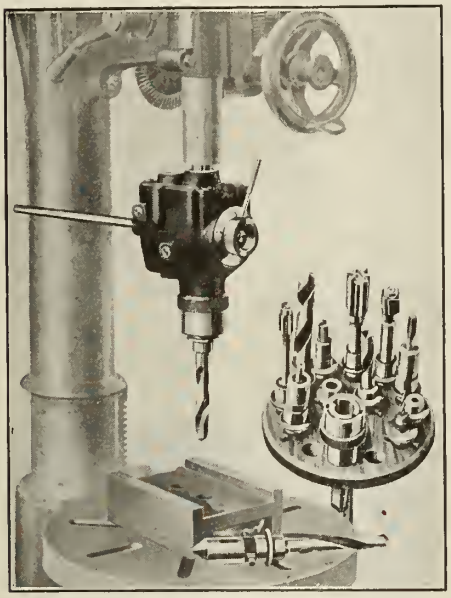
the cutting speed, obtained by a speed variator through heavy cut steel gearing running in oil, and the bearings are so constructed as to receive ample lubrication. The changing of speed is accomplished my shifting levers conveniently located on the case. The power is transmitted from the speed variator to the driving head by a shaft placed within the frame. All driving shafts are of high carbon steel and run in brass boxes scraped to fit.

There are four instantaneous changes of feed ranging from 1-16 in. to 3-16 in. per turn of the axle, obtained through a feed box. The gears, which are steel, run in oil and are operated by a lever placed in the centre of the lathe. The tail stocks have a bearing on the bed of 24 inches. They are secured in position by four heavy bolts and binders. The spindles are adjustable by means of screws and handwheels and are clamped with split binders.

The carriages are driven by splined feed shaft, through rack and pinion. The direction of the feed is changed at the apron, the carriages being independent of each other. The carriages have a bearing on the vees of 30 in., which are scraped to fit. The carriages also have a bearing on the back of the bed which takes up the forward thrust, thus overcoming the tendency to raise them from the vees when the burnisher is used.

The rack is of steel, 15-18 in. wide, 6 pitch; while the feed shaft is 1 15/16 in. diameter. The bed is rigidly constructed, being strongly reinforced with cross ties of box pattern.

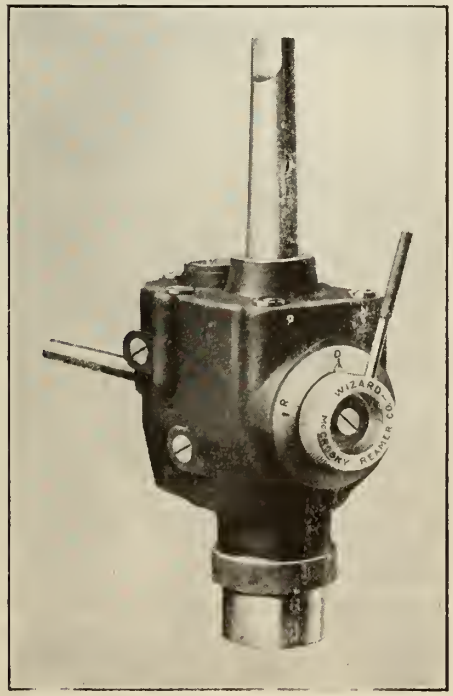
The distance between centres is 54 in. minimum, and 105 in. maximum respectively; the swing over the ways is 27 in., over the carriage, 13½ in., and in the gap 45 in. The centres are tool steel, 2 7-16 in. diameter.



The driving pulley is 30 in. diameter for 8 in. belt, and the countershaft carries a pulley corresponding to the driving pulley on the lathe, also tight and loose pulleys, 24 in. diameter for 10 in. belt. The loose pulley is brass lined and the hangers self-oiling.

In the case of motor driven machines the motor is either placed on top of the speed variator case as shown in the cut or driven through gears. In the last instance, the motor is placed on a base in connection with the cabinet leg of the machine. Two extra inside carriages for the refinishing of locomotive and tender axles with inside bearings are provided, and when so equipped the machine is very complete for any axle repair work which may be necessary on car, engine or tender truck axles. A swing of 55 inches in the gap can also be arranged to accommodate trailer truck axles.

The weight of lathe with two carriages is 16,000 lbs. net, and with four carriages, 18,000 lbs. net.



DRILL CHUCK WITH VARIABLE SPEED AND REVERSING ATTACHMENT.

SIMPLICITY and strength are noteworthy features of the chuck and collets here illustrated. The chuck consists of only two main parts—a driving body with Morse taper shank to fit

"WIZARD" CHUCK WITH VARIABLE SPEED AND REVERSING ATTACHMENT.

the drill press spindle, and a slotted collar to hold the collet up in the driving body. This collar is held on the driving body by a large hardened headless screw, and contains the long coiled music-wire spring that keeps the collar in closed position. A thin sleeve is also screwed over the slotted portion of the collar merely to cover up the slots and screw. To take off the collar, it is necessary first to remove this sleeve. These chucks are hardened and ground all over, inside and outside, while the collets are drop-forged, machined, hardened and ground. The whole collet is one solid piece of steel.

VARIABLE SPEED AND REVERSING ATTACHMENT.

The operation of the chuck is instantaneous and simple. A slight resistance to the collar with the hand, while the spindle is in motion throws the key slot in the chuck open, so that the collet will either fall out or slip into the slot. The spring within then throws the collar back to closed position, closing the key slot and locking the collet in place. Thus, a touch to the collar releases one tool and another tool is inserted with another touch. The motion of the spindle itself does the work.

The variable speed and reversing attachment has been designed to complete and perfect the above described chuck. It furnishes a variety of speeds for the different tools, and a reverse for tapping, etc. By a slight turn of the knurled knob, accomplished with the small knurled handle or lever, it is possible to have instantly any one of three speeds forward and a reverse. For example, should you wish to use in succession a small drill, a large drill, and a tap on the same job, the chuck and collet feature would of course make it easy to change from one tool to the other without stopping the machine, and the variable speed and reversing feature would give you a high speed for the small drill, an intermediate speed for the larger drill, a slow speed for the tap, and a reverse with quick return for backing out the tap.

The McCrosky Reamer Co., Meadville, Pa., are the designers and manufacturers of the above mechanisms.

The Polson's Ironworks, Ltd., Toronto, launched on March 4th the first of six steel scows being built for the Quebec Harbor Commissioners. The ice alongside the ways had to be broken up by means of dynamite. The scows are 144 feet long, and have a beam of 42 feet, with a carrying capacity of 500 cubic yards, and are to be used in connection with the Quebec harbor improvements. An order from the Dominion Government for a third steel steam lighter for the Hudson's Bay terminal at Port Nelson has been received by the Polson's Ironworks, Ltd. The vessel will have a length of 120 feet over all and a beam of 21 feet 6 inches, with a 10-foot draught, and is to be delivered at Port Nelson by July 1st, one month later than the two other vessels on hand, which are to be ready at the opening of navigation. The securing of these boats will obviate any further difficulty such as that experienced last year through vessels being unable to lighter their cargoes for lack of proper facilities, and through the impossibility at present of docking large vessels at the port.

MISPLACED CREDIT.

WE read the other day of the triumph of a certain city over a public utility corporation doing business within its borders, in the matter of a point of law relative to the privileges granted to and the conditions to be observed by the latter. Credit, of course, was generally given the city's representative in the person of its legal luminary for the successful outcome of the court proceedings. It transpires however, that other and at least equally zealous champions of the city's welfare had carefully scouted the battle ground of the opposing party, and had so trained their guns and developed their plan of attack that in any case victory was inevitable. In other words, the opposing party hadn't a leg to stand upon in their contention, therefore, consummate forensic ability counted for little in the successful result.

We are inclined to think that there is a strong tendency in every sphere of enterprise and endeavor to misplace credit—a failure "to give honor to whom honor is due." It seems to be part of our general make-up to conclude that he is the hero who bears away the spoils of victory, and that they who blaze the trail are but insignificant conveniences and, therefore, of no account. We are so superficially intelligent as to be unable to discern otherwise, and, may we add, so stupidly content, as to desire to remain so. In every sphere of human endeavor and enterprise, social, commercial, industrial, political and religious we give credit to individuals in a collective or unit capacity for compassing some scheme for the general moral uplift, for the completion of some great railroad or transportation undertaking, for the inauguration of some movement which makes for the welfare and safety of workpeople in our factories, for the stand on some question of national policy by a political party which a more or less selfish interest most probably instigated, and for the unification of Christendom by the adoption of one creed and one set of doctrines, yet, are oblivious, the while, to the fact that we and many others also took a part in the game.

Some people would have us believe that to-day in commercial and industrial enterprise "the race is to the swift and the battle to the strong only." Those who dispense this line of wisdom are, however, either of the silver-spooned birth variety or of the semi-invalid type, who have never known what it is to earn a living or who have had a hand-picked portion placed at their disposal by some interested spirit. The misplacing of credit is both a crime and a curse, robbing as it does the deserving of their birthright and bringing ultimate discredit and ruin on its originators and the recipients. The oft quoted statement that "there is honor among thieves" has no existence in fact, and never had, else we would have more honor to our credit as individuals, as a community, and as a nation, and have fewer thieves. In like manner if we properly allocated the credit due each individual either in his craft or in his citizenship, there would not only be a greater co-operation and unity of interest, but a disappearance of that suspicion of motive and enmity bred of distrust.

In all business enterprise there are to be found two classes of employees—the producers and the non-producers, and it goes without saying that the former get the credit, if that happen to be a feature, and the latter are either ignored or are reminded of their uselessness, although unfortunately necessary existence on the pay-roll. Diagramatically and by ofttimes reiterated address and writing we are informed that direct personal touch with and tab on all the employees of our large manufacturing concerns is kept and that a magnetic influence emanating from the peak of the organization draws worthy character and service thereto. We are also told, and examples are quoted and multiplied, of men who neither would nor could be kept down in their ambition to rise to high place, but we are without record of those who failed, not because of their lack of the qualities necessary, but purely on account of a misplacement and in many cases through the appropriation by others of the credit due them.

Only the other day, to quote an example dealing with a topic which is filling a large place in the Canadian political and industrial world at the present time, viz., the application for Government assistance by the C.N.R., there was being widely circulated the report that the C.P.R. was exerting its powerful influence to oppose the desired financial help. Rightly or wrongly the latter railroad management were being so credited, and only when the highly significant words of the C.P.R. president were given voice to "that it was not the C.P. (Canadian Pacific), but the **Canadian People** who were in opposition to a further grant to the C.N.R., was it apparent that here was another obvious case of misplaced credit. In this instance, it was a desire to save its face on the part of the Canadian people and its representative Government.

It exemplifies misplacing credit by blaming another, and differentiates only from that in which another's reward is purloined. The baneful effects are the same however, in each case.

INDUSTRIAL NOTABILITIES--No. 25

THE McClary Manufacturing Co., with headquarters at London, Ont., and branch establishments in leading cities of the Dominion, occupies through its products in Canadian hearts and homes a place equally prominent with that of its purely relative industrial importance.

John McClary, London's Grand Old Man, in his declining years, is necessarily less of the active and guiding spirit in the enterprise which he founded and fostered, yet, notwithstanding, development and achievement still go on, and to the ability and capacity of his lieutenant, the subject of this sketch, W. M. Gartshore, vice-president, who through four decades has been connected with the McClary Co., the credit is in large measure due.

William Moir Gartshore was born at Dundas, Ont., in 1853, being the son of John Gartshore, manufacturer of engines, boilers, mill supplies, etc., who supplied the first compound marine engine on the lakes, and the engines for the first waterworks system of the City of Hamilton, Ont. The latter engines are, we believe, still in operation.

Mr. Gartshore received his education in Dundas and at the hands of Dr. Tassie, of Galt, Ont., following which he entered the employ of the Toronto Car Wheel Foundry in 1870, and remained there three years. He was superintendent of the London Car Wheel Foundry from 1873 to 1876, in which latter year he became associated with the McClary Mfg. Co., advancing with its growth and development to his present position of vice-president and general manager.

WILLIAM MOIR GARTSHORE.

In matters military, Lieutenant-Colonel Gartshore has a record of 34 years with the Canadian Militia, occupying the various intermediate ranks up to Brigade Commander. He saw active service as Major of the 7th Fusiliers in the North-west Rebellion of 1885, and was in command of the 1st Hussars for 8 years.

The spotlight of public life does not appeal to the subject of our sketch, a period of two years' service as Alderman of the City of London, Ont., having satisfied his thitherward inclinations. Notwithstanding this, he by no means stands aloof from the active performance of works of mercy, being always ready to bear a man's part in the prevention and alleviation of human suffering.

As a consequence, we find him chairman of the Board of Trustees, Victoria Hospital; president, St. John's Ambulance Society, and president of the Industrial Bureau, all of London, Ont.

The "Welfare Work" department of the McClary plant at London, owes its inception to him, and no more active personal interest in its every feature is to be noted than his. The writer had the pleasure of inspecting the provision made for the employees' welfare in company with Lt.-Col. Gartshore some time ago, on which occasion it was easily apparent that his heart was in the work.

Lt.-Col. Gartshore is a Liberal in politics, but differed with his party at the last general election regarding the question of reciprocity with the United States.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., March 9, 1914.—An under-current of improving trade seems to be making itself gradually felt, though there are no very easily read surface indications of better times being at hand. However, business men, generally speaking, seem to think that by the end of April a big improvement will be seen.

The Dominion Bridge Company and the Phoenix Bridge Company have both got plenty of work on hand at present; but at nearly all the other large local industrial plants things are very quiet. The Angus shops of the C.P.R. have been on short time now for several months and we are informed that there is no present prospect of a resumption of normal working hours.

Several representatives of car-building companies have been seen at Ottawa during the past week and rumor says that the Intercolonial Railway is contemplating placing further orders for rolling stock. While railway earnings, especially in the West, have been showing a marked decrease as compared with 1913, tonnage on the Intercolonial has been well maintained. Large quantities of pulpwood are awaiting shipment at all stations along the Quebec section of the road and the present rolling stock of the road is said to be fully employed. Owing to the scarcity of orders on hand at present, the car builders would doubtless be able to quote attractive prices just now.

In the metal market there is a good volume of business being done in sheets, prices remaining firm. There is also a good demand for light plates. With regard to pig iron, dealers report but few inquiries. However, generally speaking, foundries are fairly busy and their stocks of pig on hand can scarcely be large enough to carry them on much longer. Stocks of British pig in warehouse are now very low and few orders for the opening of navigation have as yet been placed.

Tin is down ½ cent per lb. this week, while copper remains unchanged.

Toronto, Ont., March 10, 1914.—Very little improvement can be reported over last week as regards the general state of the market. The conditions affecting business, as a whole, have not changed in any marked degree, although a slight improvement in some lines may be expected in the near future.

This improvement noted above, refers more especially to the machine tool business, which, although quiet, shows distinct signs of a revival, indicated more or less by the number of inquiries being received by dealers. The number of orders booked during last week shows an increase over previous weeks although they refer generally to single machines. No large inquiries seem to be about, the uncertain condition of the money market being no doubt indirectly responsible. We understand that the Woodstock Concrete Machine Co., have placed an order with a local house for a shaper and drill.

The demand for tool steel and machine shop supplies is fairly good, although the orders that are being placed, are as a rule only for very immediate requirements.

Dealers in structural shapes, bars, etc., report conditions as being quiet with little improvement to be expected in the immediate future. Prices in the States show a continued tendency to stiffen and slight advances may be expected there in the near future, which will no doubt affect the local market. Few orders are being booked and stocks are becoming light, firms only buying to cover immediate requirements. We understand that some firms are endeavoring to place orders for future delivery at current prices, but the mills are not inclined to accept business on these terms. This, together with the increased tonnage being produced at the mills in the States, indicates that an advance in prices may be looked for. Pig iron is quiet, and no upward movement in prices can be expected meantime.

The metal market is quiet and no great change is anticipated. Prices are firm except for tin, which has weakened, being quoted at $41.00.

OCEAN FREIGHT RATES.

"This is the biggest issue in the life of Canadian trade and commerce to-day," said O. B. Wood, of Hamilton, at the Associated Boards of Trade meeting a few days ago in urging that the Government take action to reduce ocean freight rates. "The combine which controls ocean freight rates is the greatest and most iniquitous in the world to-day. It is driving wheat out of the country to be milled, for the reason that 8¾ more cents is charged for flour than wheat. The life of trade and commerce is being sapped, but this is not an age of slavery and serfdom and the remedy is in sight.

"I would suggest that the Government spend $5,000,000 in establishing a line of steamers to combat the high rates."

The resolution under discussion was: "That the Ontario Boards of Trade strongly urge the Government to immediately appoint a commission for the purpose of investigating the excessive charges in ocean rates and to take further action which will result in the appointment of a permanent commission with power to control and regulate such rates?"

The original resolution was changed to read that "Whereas the report of the commission shows that there is a combine, we urge that the Government establish a line of ocean freight boats."

GOVERNMENT 1914 ESTIMATES.

Ontario estimates, other than Toronto, for public works and harbors and rivers, exclusive of revotes, as tabled in the Commons on Jan. 29, are as follows; in each case the amount being for a "public building" unless otherwise specifically stated:

Acton, $20,000. Aurora, $25,000, Aylmer, $30,000.

Barrie, drill hall, $25,000, Berlin, $50,000. Bracebridge, $30,000. Brantford, $20,000. Brantford, new drill hall, $75,000. Burford, $20,000, Burk's Falls, $20,000. Brussels, $25,000.

Campbellford, $20,000. Collingwood, $75,000.

Dunnville, $20,000. Durham, $25,000. Eganville, $28,500. Elmira, $37,000. Exeter, $15,000.

Forest, $20,000. Fort Frances, $25,000. Fort William, custom house and examining warehouse, $125,000. Fort William, drill hall, $30,000.

Galt, drill hall, $35,000. Gananoque, postoffice, to complete, $8,000. Georgetown, $20,000. Gravenhurst, $20,000. Grimsby, $15,000.

Hamilton, enlargement and improvements to public buildings, $50,000. Hamilton, postal station "B," $5,000. Hanover, $25,000. Hespeler, $25,000. Huntsville, $20,000.

Ingersoll, public building addition, $15,000. Ingersoll, drill hall, $15,000.

Kemptville, $15,000. Kingston, R. M. C. covered drill hall, $15,000. Kingston ordnance store buildings, $10,000. Kingsville. $20,000.

Lakefield, $20,000. Lindsay public building improvements, $20,000, Listowel, drill hall, $20,000. London, postoffice building, $100,000.

Midland, $25,000. Millbrook, $20,000. Milton, $20,000. Milverton, $20,000. Morrisburg, $20,000.

Napanee, drill hall, $25,000. Newmarket, $20,000. New Hamburg, $10,000. Norwich, $20,000.

Orillia, public building, additional, $30,000. Ottawa, departmental buildings, fitting, etc., $75,000. Ottawa, new drill hall, $50,000. Owen Sound, drill hall, $50,000.

Palmerston, $20,000. Parry Sound, $20,000. Pembroke, drill hall, $35,000. Perth, $25,000. Peterborough, $50,000. Port Arthur, drill hall, $100,000. Port Arthur, custom house and examining warehouse, $80,000. Preston, $43,000.

Seaforth, $5,000. Shelburne, $50,000. Southampton, $20,000. Steelton, $30,000. Sudbury, $100,000.

Tilbury, $5,000.

Uxbridge, to complete public building, $4,000.

Walkerville, $35,000. Wallaceburg, $25,000. Watford, $20,000. West Lorne, $20,000. Weston, $10,000. Wiarton, $20,000. Windsor, drill hall, extension, $25,000.

Total, $4,247,245.87.

Harbors and Rivers.

Cobourg, harbor improvements, $50,000. Collingwood, harbor improvements, $75,000. Fighting Island (Detroit River), improvements of channel, $57,000. Gananoque, wharf, $18,000. Goderich, harbor improvements, $120,000. Hamilton, harbor improvements, $100,000. Kingston, harbor improvements, $150,000. Oshawa, harbor improvements, $50,000. Owen Sound, harbor improvements and repairs, $50,000. Peterborough, dry dock, $25,000. Picnic Islands, improvement of channel, $100,000. Port Dover, harbor improvement, $50,000. Port Hope, harbor improvement, $30,000. Portland, wharf, $5,000. Port Stanley, harbor improvement, $105,000. Sarnia, wharf and shelter basin, $50,000. Sault Ste. Marie, harbor improvement, $100,000. Thornbury, harbor improvement, $17,500. Trenton, harbor improvement, $76,000. Victoria, harbor wharf, $16,000. Wellington, wharf and harbor improvement, $35,000. Whitby, harbor improvement, $11,000. Windsor, landing dock and improvements, $40,000. Total, $2,178,178.

What Toronto Gets.

Harbor improvement, $1,000,000 (including $866,000 previously voted.

Custom house and Postal Station A, $500,000.

Military building, $220,000.

Postoffice, Queen and Saulter streets, $100,000.

West Toronto postal station in Ward 6, $50,000.

Dominion building, $12,000.

North Toronto postal station, $4,500.

Postoffice, Spadina avenue and Oxford street, $75,000.

Total, $1,961,500.

PROBLEM OF THE THRUST BEARING.

HENRY T. NEWBIGIN in a recent paper read before the Institution of Civil Engineers, drew attention to the inefficiency of thrust bearings as compared with journal bearings and their disadvantages, especially in high-speed machinery. A comparison was made between Coulomb's laws of friction and the late Professor Osborne Reynolds's hydrodynamic theory of lubrication, and coefficients of friction in bearings of various forms were given, while the way in which the friction in a journal bearing changes from dry or greasy friction to perfect lubrication as the speed increases was also discussed. The late Beauchamp Tower's discovery of liquid pressure in the oil-film was described.

Viscosity was defined, and the resulting general formula compared with the results of Mr. Tower's and Professor Goodman's experiments. The conditions necessary for the maintenance of liquid pressure in an oil-film were also examined and defined.

The subsequent developments of Reynolds's hydrodynamic theory of lubrication were referred to, and A. G. M. Michell's formulae for the resistance of lubricated plane surfaces were cited: the paper concluding with description, illustrations and the results of tests of thrust bearings constructed on Michell's principle.

Book Reviews

The D'Este Steam Engineers' Manual, with Electrical Appendix by Charles Penrose, 448 pages, 4½ x 7 in., 240 illustrations, with four plates. Full leather binding gilt edges. Published by the Julian D'Este Company, Boston, Mass. Price $2. This is an exceedingly useful handbook for practical power plant engineers, covering both the mechanical and electrical ends. The book is arranged in two parts, the first containing 138 pages and dealing with the mechanical side, while the second part called the Electrical Appendix and written by Charles Penrose, contains 351 pages, and is devoted to the practical end of electrical engineering. In the first part the mathematics which would be useful to a steam plant engineer, are dealt with briefly. Succeeding chapters are devoted to the theory of steam, care of steam boilers, evaporative tests, pump data, strength of and power transmission by shafting, strength of riveted points and boiler shells, etc. Descriptions of plant equipment are given, covering mechanical stokers, measurement of mechanical energy, belting, and the steam engine indicator, while other chapters deal with valve setting, mechanical refrigeration, etc., and conclude with a number of mathematical tables. The introductory chapters of the second part are devoted to a discussion of electrical units, electrical measurement and the fundamental features of the operation of dynamo electrical machinery. Later chapters deal with temperature measurement by electrical means, photometry and a synopsis of present day electrical equipment of alternating current generating stations. In connection with this chapter there is an interesting folding chart showing the layout of the equipment employed and the relation between the various units. Other chapters contain illustrations of modern generating sets, high tension equipment and distributing switchboards. The three other folding charts show respectively the layout of a steam plant and the connection between the various units employed; sectional view of a steam electric generating station, and a connection diagram of a typical hydro-electric generating station. The book contains a large number of illustrations and diagrams, the reading matter is clear and well arranged, and the covers are attractive, being of leather.

T. B. F. Benson, naval architect, of Toronto, has been appointed Lloyd's surveyor for the Lake Ontario and Collingwood districts.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

F. H. Anson has returned to Montreal from Chicago.

C. B. Gordon, of Montreal, has been elected president of Penmans, Ltd.

James Carruthers and J. W. Norcross, of the Canadian Steamship Lines, were in Ottawa recently.

C. Hamilton-Wickes, His Majesty's Trade Commissioner for Canada, has been in Ottawa recently.

Oscar B. Mueller, president of the H. Mueller Mfg. Co., Sarnia, Ont., has been elected president of the Board of Trade for that town.

Superintendent Halfyard, of the Canadian Buffalo Forge Co., Montreal, visited Toronto last week on his way to Berlin, Ont.

F. Orr Lewis, of Vickers, Ltd., and Lewis Bros., Montreal, sailed for Canada last Saturday. Mr. Lewis has been in the Old Country on a business trip.

Captain Joseph Wiggins, a captain of vesesls on the Upper Lakes in the old days, died in Toronto on March 5 in his ninety-first year. He was born in that city.

L. P. Packard, manufacturer of the boot blacking bearing his name, died in the General Hospital, Montreal, after a lingering illness. He was born in Boston in 1839.

G. W. Ross, chairman of the Montreal Harbor Commission, and Mr. F. W. Cowie, chief engineer, are now at Marseilles on a tour of inspection of the principal European ports.

C. E. Jenney, city passenger and ticket agent of the Grand Trunk, Toronto, has been appointed general agent passenger department, Vancouver, to succeed Mr. Duperow.

W. J. Moffatt, travelling passenger agent, Grand Trunk Ry., with headquarters at Toronto, has been appointed city passenger and ticket agent, Toronto, succeeding Mr. Jenney.

Thomas H. Mawson, the English landscape architect who has been in Vancouver several times doing work for the park board, has been commissioned by the King of Greece to remodel parts of the famous city of Athens.

Captain William McIlwain, Government examiner of master and mates, died in St. Catharines on March 2, aged 87 years. Deceased was Governmgent examiner for twenty-two years.

H. J. Glaubitz, general manager of the Water Commission, London, Ont., has been given five weeks' leave of absence by the board. He intends making a trip to his old home in Germany.

W. E. Duperow, general agent Grand Trunk Ry. passenger department, Vancouver, has been made assistant general passenger agent of the Grand Trunk Pacific, with headquarters at Winnipeg.

WHO'S WHO.

W. ATTWOOD.
Manager Pump Department, Bawden Machine Co., Toronto.

S. R. Joyce, ticket clerk in the Toronto city ticket office, Grand Trunk Ry., has been appointed travelling passenger agent, with headquarters at Toronto, succeeding Mr. Moffatt.

President Taylor and Vice-president Franz, of the Lake Superior Corporation, returned on March 3, from New York, where they had been in attendance at the regular monthly meeting of the corporation directors.

W. W. Janney died at Galt on March 7, aged 61. Mr. Janney was associated with the Shurley Dietrich Co., Saw Works since its inception, and for many years acted as general superintendent of the factory. Latterly he became a member of the company.

A. Butze, for sixteen years general purchasing agent of the Grand Trunk system in Montreal, died at St. Louis, Mo., aged 68. Mr. Butze retired from the Grand Trunk System in January, 1912, and had since that date occupied a similar position with the National Steel Car Co., Hamilton, Ont.

MEETING OF THE CANADIAN MINING INSTITUTE.

THE Canadian Mining Institute held its sixteenth annual meeting on Wednesday, Thursday and Friday of last week at the Ritz-Carlton Hotel, Montreal.

The annual report of the council made special reference to the meeting of the International Geological Congress in Canada last year. While the institute was not officially responsible for the conduct of the meeting, the organizing and directing committees were composed almost entirely of officers and prominent members of the institute, and the success of the Congress redounded to their credit. The membership for 1913 was 1,029, or 6 less than in 1912, the slight decrease being due to the reduced membership of the affiliated student societies at McGill and the Kingston School of Mining. The treasurer's report showed receipts of $18,575 in 1913, including a bank balance of $5,295 at the beginning of the year. The disbursements were $12,907. These reports were adopted.

The following officials for 1914 were elected:—

Past Presidents—Dr. W. G. Miller, Toronto; Dr. F. D. Adams, Montreal; Dr. A. E. Barlow, Montreal.

President—G. G. S. Lindsey, Toronto.

Vice-Presidents—Thos. Cantley, New Glasgow, N.S.; Charles Fergie, Montreal; W. F. Sutton, Victoria, B.C.; A. A. Cole, Cobalt, Ont.

One of the most interesting addresses was that delivered on the first day of the meeting by Dr. Edward D. Peters, professor of metallurgy at Harvard, the title of whose paper was "The Production of Heat in Metallurgical Furnaces." Other interesting papers were read by Mr. F. D. Reid on "Milling Practice in Cobalt," and by George A. Guess, Toronto, on "Pyritic Smelting."

A large number of delegates attended the meeting, which was one of the most successful yet held by the institute.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Berlin, Ont.—The Rutenber Co., are building a factory for the manufacture of automobile engines.

London, Ont.—The Cook-Fitzgerald Co. have obtained permission from the council to extend their power plant.

Hamilton, Ont.—The Dominion Chain Co. are building a factory for manufacturing chains. Machinery will be required.

Edmonton, Alta.—A contract for drilling for gas near Viking was signed by the Edmonton Industrial Association on March 5, at $10.50 per foot.

Quebec, Que.—An auxiliary power unit has been purchased by the Quebec Daily Telegraph. The unit consists of a 50-h.p. gas engine and generator.

Port Arthur, Ont.—It is stated that if the Government would grant a bonus on iron ore mined in Canada a local syndicate would establish a steel plant here.

Edmonton, Alta.—It is reported that an eastern company manufacturing automobiles are negotiating for a site in the Village of Beverley, where they will erect a factory.

Winnipeg, Man.—A site has been purchased at St. Boniface by the Wm. Galloway Co., who contemplate the erection of a plant to manufacture agricultural implements.

Vancouver, B.C.—It is reported that the Phoenix Mfg. Co., Eau Claire, Wis., will build a factory for manufacturing tractors, gas-electric engines. J. S. MacDonald is interested.

Berlin, Ont.—The Berlin Light Commission is calling tenders for a 350,000 cubic feet gasholder, 2-lift telescopic type, and steel tank. John Keillor, consulting engineer, Hamilton, Ont.

Ingersoll, Ont.—It is considered probable that Wilson & Short, of Detroit, will purchase the Standish Manufacturing Co.'s plant, and install equipment for manufacturing automobile specialties.

Sault Ste. Marie, Ont.—Mr. J. Frater Taylor, president of the Lake Superior Corporation, announces that they have been authorized to borrow $2,500,000 to enable them to proceed with extensions under way.

Hamilton, Ont.—A sewage pumping station and extensions to the Trolley Street plant, which will cost $110,000, will be started this spring.

Vancouver, B.C.—A site has been purchased on Burrard Inlet by the Imperial Oil Company, who will build an oil refinery at a cost of approximately $500,000. Work on the buildings will commence shortly.

Thorold, Ont.—Voting on a by-law will take place on April 2 to grant concessions to a syndicate who are proposing to build a plant for the manufacture of abrasives. Mr. James Battle is interested.

Vancouver, B.C.—DuCane, Dutcher & Co., engineers, have applied to the city council for a franchise to build a central heating plant. In connection with this application City Engineer Rust has submitted a report.

Orillia, Ont.—Alex. Grant, chief engineer of the Trent Canal, has sent the Water, Light and Power Commission copies of the plans for the work at the Swift Rapids, including the new power house for the town.

Englehart, Ont.—A proposition has been submitted to the town council by Mr. K. Farah regarding the development of High Falls. Mr. Farah is owner of the Charlton-Englehart Power Co., and is prepared to expend $400,000 on the development of the Falls.

Guelph, Ont.—The Canadian Products, Ltd., have purchased the plant of the Standard Fitting and Valve Co., on the York Road, which has been lying idle for some time The president of the new company is W. B. Hinman, of Cleveland, Ohio, and he is associated with a number of business men of that city. The new company has beeen incorporated with a capitalization of $100,000. It will manufacture high carbon steel structural tubing. New machinery has been ordered.

Electrical

Calgary, Alta.—Tenders are being called for two 3,000 k.w. transformers.

Kingston, Ont.—The Board of Trade are urging the city council to conclude arrangements with the Hydro-Electric Commission for securing cheap power for the city.

Ford, Ont.—The council have decided to use Hydro-electric current for the street lighting system.

St. Mary's. — Mayor Butcher and Councillor Bartlett visited London on March 5, to attend the Hydro Radial Convention.

Simcoe, Ont.—The present contract for street lighting expires in July, so the council are considering the question of opening negotiations with the Hydro-Electric Commission.

Blenheim, Ont. — Blenheim wants hydro-electric service. Mayor J. B. Smith has written to Hon. Adam Beck, and a public meeting is expected to be held soon to consider the proposition.

Walkerville, Ont.—Mr. Murphy, manager of the Walkerville Light & Power Co., has been requested to make an inventory of the property of the company as a preparation for the sale to the Hydro Commission.

Ottawa, Ont.—For the first time in history the Government here has been in direct telegraphic communication with Port Nelson by wireless to the Pas, and thence by a land line to Ottawa. The message was received on February 23.

Sudbury, Ont.—The Fire, Water and Light Committee are considering the advisability of installing water meters in all industrial and public buildings on account of the large amount of water wasted annually. C. F. Carmichael, chairman.

London, Ont.—Westminster Township Council sent to the Ontario Power Commission a petition from ratepayers asking for estimates on hydro-electric power. Farmers of the township desire to make use of Niagara power in agricultural and daily work.

Windsor, Ont.—At the Sandwich council meeting on March 3, with Reeve McKee in the chair, a contract was submitted by the Essex County Light & Power Co., asking the council to give its approval. It was considered too complicated to handle, however, and was referred to the town solicitor.

Burford, Ont.—Burford ratepayers, on March 9, carried by 28 majority a by-law enabling the municipal council to enter into a contract with the Hydro-Electric Commission for Niagara power, and also a money by-law providing for erection of a distributing station and

equipment. The number of votes polled was 95.

Quebec, Que.—Professor Herdt, of McGill University, who has been investigating the lighting system of the Dorchester Electric Company on behalf of the City of Quebec, will present his report to the council in a very short time, and it is likely that a number of changes will be necessary to perfect the lighting of the city's streets.

Toronto, Ont.—The Provincial Hydro-Electric Commission is advising the Toronto Hydro-Electric Commission to acquire the plant of the Interurban Electric Co. of West Toronto for $280,000, in which is included $180,000 for physical assets, and $100,000 for the intangible assets. The gross business of the company is estimated at $85,000.

Aylmer, Ont.—At a meeting to consider guaranteeing the bonds of the London and Lake Erie Traction Line extensions to Aylmer and Sparta, an agreement was reached that the matter be referred to the people, and a vote taken on it. Aylmer's total was reduced from $40.000 to $30,000, and the sum Malahide will be asked to vote is $20,000. St. Thomas and Yarmouth will have the balance to make up.

Strathroy, Ont.—At a meeting of the town council a by-law authorizing the borrowing of $25,000 by the sale of debentures to provide for the cost of a plant to distribute electric light and power supplied by the hydro-electric power commission was passed. A by-law to provide for the supply of water and electric light free of charge to, and the fixing of the assessment of, the Canadian Handle Manufacturing Co. was passed.

Kincardine, Ont. — Mayor Mitchell and Reeve Hunter have interviewed the Hydro-Electric Commission with reference to power for this section of Bruce County. The chief engineer promised that a price per horse-power would be given some time in June. The scheme is to hook up the Saugeen and Eugenia Falls with Niagara power. The mayor said that what Bruce County towns want was electric power to place them upon an equal footing with other manufacturing centres.

Contracts Awarded

Ottawa, Ont.—The Dominion Government has awarded a contract for six 200-ton mechanical coaling plants to Roberts & Shaeffer Co., Chicago, Ill.

Winnipeg, Man.—A contract has been let to the Northern Construction Co. to build a railway from Winnipeg to Shoal Lake. The railway will be 65 miles long, and cost $500,000.

Municipal

Preston, Ont.—The town council are considering making extensions to the waterworks system.

Calgary, Alta.—City engineer G. W. Craig has submitted to the city council alternative plans for a bridge over the Bow River.

Weston, Ont.—It is proposed to raise a sum of money for the purpose of advertising the town in the Toronto daily papers. A publicity agent will be appointed.

Hamilton, Ont.—The city has secured a more favorable rate from the Hydro-Electric Commission for the operation of the waterworks pumps at the Beach station.

Windsor, Ont.—City Engineer Brian thinks that Windsor should have an incinerator plant. The latter cannot be operated economically on less than fifty tons a day.

Hamilton, Ont.—It is announced that the city wil call tenders for equipment for the fire department, which will include a gasoline tractor, ladders and a quantity of hose.

St. Lambert, Que.—The town have sold bonds to the value of $480,000 for the completion of the sewage system and side walks. Street lighting equipment will also be required.

Stratford, Ont.—The city council are considering the question of installing an incinerator. Ald. D. A. McLachlin is chairman of a special committee appointed to look into the matter.

Brockville, Ont.—The draft agreement between the town council of this place and the Morrisburg Electric Railway Co. has been prepared and will be taken up by the council this week.

Sault Ste. Marie, Ont.—At a recent meeting of the city council the advisability of installing an incinerator was discussed at some length and laid over to be taken up again at a future date.

Moose Jaw, Sask.—The city is contemplating installing a distributing system for natural gas. Georgeson & Co., have submitted a proposition to furnish gas to the city at 20 cents a thousand feet.

Kingston, Ont.—The city council will probably make application to the Ontario legislature for permission to put a by-law to the people for raising $24,000 for the purchase of land at the outer station to be held for industries.

Sarnia, Ont.—The Board of Trade has decided to raise $5,000 to finance a publicity campaign. A publicity commissioner will probably be employed. Oscar B. Mueller is president of the Board of Trade.

Thorold, Ont.—It is announced that a company has purchased a site here and will erect a factory. A by-law will be voted on April 2 to grant the necessary concessions. No further particulars are at present available.

St. Thomas, Ont.—A committee composed of Mayor Johnson, Chairman Horton and Ald. Meehan has decided to purchase a fire truck at a cost not to exceed $4,000. Two men will be added to the permanent staff of firemen at a salary of $60 a month.

Wingham, Ont.—At the regular meeting of the Wingham town council on March 2, the report of the electric light committee was adopted that debentures be issued for $2,500; $1,500 for line extension and $1,000 to complete work of installing new machinery at the electric light power house.

Windsor, Ont.—Ratepayers of Windsor voted on March 3, in favor of three industrial by-laws. The concerns benefited are: The Central Ice & Storage Co., a newly-organized concern, which will manufacture artificial ice on a large scale; the Ideal Concrete Machine Co., and the Dowsley Spring & Axle Co. All of these will be granted the usual exemptions.

Hamilton, Ont.—The following tenders have been recommended to the city council by the Board of Control. Brass fittings—H. Mueller Co., Sarnia, $3,639; hydrants—Canadian Allis Chalmers Co., Toronto, $49 each; castings—Hamilton Foundry Co., $1.85 per 100 pounds; iron pipe—Gartshore-Thomson Co., Hamilton, $31.50 per ton; lead pipe—Tallman Brass Co., $6 per 100 pounds; pig lead—Tallman Brass Co., $4.85 per 100 pounds.

Toronto, Ont.—Parks Commissioner Chambers has been instructed by the Parks Committee to make a report upon a bridge across the Don connecting the two sections of Riverdale Park. Two schemes have already been prepared, one costing $50,000, and the other $30,000, the Parks Commissioner favoring the latter proposition. He will supply full details of both proposals at the next meeting of the committee, when the aldermen will pass upon them.

Montreal, Que.—Two new 12-million gallon pumps are to be bought by the city at once, and other improvements are to be made to the pumping system which will cost $144,000. A report to that effect was submitted to the city council on March 4th by the Board of Control. The

items in the report are: For a conduit to supply the new pumps, $25,000; two 2-million gallon pumps and boiler building, $85,000; two boilers, $24,000; and a new brick chimney and connections, $10,000; making a total of $144,000.

Montreal, Que. — Another step towards the completion of the city's new filtration plant at Point St. Charles, was taken on March 4, with the opening of tenders before the Board of Control, for contract No. 4, comprising pump house and other buildings for the plant. The tenders were referred to the chief engineer for report. The contractors and tenders were: F. J. Jago Co., alternative prices, $155,000 and $159,500; A. G. Loomis & Son, $174,000 and $170,000; Norman Macleod, $193,000, and $199,000.

Kingston, Ont.—The Board of Trade is still endeavoring to get the city council to secure cheap power to induce industries to locate here, believing the city's industrial future depends almost entirely upon its ability to supply cheap power to manufacturers. The board recently passed a resolution calling upon the city council to make a strong effort at once to secure power from the Hydro-Electric Commission and to base the estimate of consumption on such reasonably optimistic figures as may insure a fairly cheap rate.

Victoria, B.C. — Estimates for the Public Works Department brought down on Feb. 26, in the Legislature amount to $5,316,575, and include the following: Works and buildings, $2,319,500; roads, bridges and wharves, $2,861,000; subsidies for steamboats, $96,075; roads and bridges, Delta, $25,000; Dewdney, $77,000; Point Grey, $20,000; Chilliwack, $37,000; Richmond, $140,000; Second Narrows bridge, conditional re-vote, $400,000; Chilliwack ferry, $8,000; Lytton ferry, $480; Mission ferry, $8,000; Hope ferry, $3,600; Pitt river, $900.

General Industrial

Listowel, Ont.—The Dry Powder Mill Co. will build a factory here.

Prince Albert, Sask.—F. Frank will probably build a fertilizer factory here.

Vancouver, B.C.—The Cascade Laundry Co. contemplate making an addition to their building.

Parry Sound, Ont.—Wm. Taylor, sen., has decided to use electricity in the operation of his tannery.

Carbon, Alta.—Mr. Colfas has purchased the electric light plant from A. Reid, and is running a chopper in connection.

Toronto, Ont.—Another fire occurred recently at the tannery of Wickett & Craig. The loss is estimated at $2,000.

Quebec, Que.—A factory building occupied by the Quebec Waist and Clothing Co. was badly damaged by fire on March 4. The loss will be about $1,000.

Princeton, B.C.—The B. C. Portland Cement Co. will probably make a large addition to their plant, which would double the capacity.

Montreal, Que.—Forty factories have been affected by the emptying of the Lachine Canal, and many of them will be compelled to run reduced staffs because of loss of power developed by the canal.

Toronto, Ont.—It is reported that the Toronto Terminal Co. is being organized to build and operate the new Union Station. It is stated that the company are negotiating for property around the present station.

Sarnia, Ont.—The Sarnia Fence Co. has agreed to turn over its entire Western business to the Grain Growers' Grain Co., which will pay an agreed price per ton for the output of the factory, and will retail it.

Redcliff, Alta.—P. J. Hogan, of Montreal, representing the United Shoe Machinery Co., arrived here last week and is now engaged in setting up the machinery in the shoe factory. He will be here about two weeks and will see the plant started.

Coquitlam, B.C.—Representatives of Canada Sabulite Co., Ltd., are negotiating a site for a plant to manufacture explosives. The company has factories in London (Eng.) and Belgium, and will start building as soon as negotiations are favorably concluded.

Estevan, Sask.—Leases for oil and gas rights on nearly 17,000 acres of land in the vicinity of Estevan have been taken out at the Dominion Land Office, and preliminary arrangements are being made for the formation of a company capitalized at $250,000.

Lethbridge, Alta.—C. S. Farrow, proprietor of the Lethbridge Steam Laundry, has ordered a modern filtration plant from the Kennicott Co., Chicago. This will provide against impure water, which nearly put the laundry out of business during the freshet season last spring.

Guelph, Ont.—It is reported that the Dominion Linen Mills, which have been closed down for several months, are about to resume operations. The property, it is understood, has been sold to a syndicate of Toronto gentlemen. A full staff of workmen will be employed, and there is plenty of capital behind the deal.

Uxbridge, Ont.—The piano factory is starting operations. Messrs. Osborne, Sortis and Bone are here, and in a few days the works will be in running shape. The prospects for a successful industry are very bright, and when mild weather comes, additional buildings will be erected.

Tisdale, Sask.—The Tisdale Trading and Knitting Co. will establish a manufacturing industry in this town. This decision has been arrived at owing to the building of the government railway from Le Pas to Port Nelson, and the fact that Tisdale is the nearest established farming district to that northern part.

Orillia, Ont.—Negotiations have been concluded between the town and J. R. Eaton & Sons regarding a loan to the company for the erection of a factory. A by-law will be submitted to the ratepayers on March 30, to ratify the agreement. Under the contract, the town agrees to loan the company $50,000 repayable in 20 years and also offers a number of other privileges.

Guelph, Ont.—H. O. Taft, Canadian general manager; Mr. Byers, Canadian superintendent; and Mr. Fisher, head of the London (England) office, all connected with the Libby, McNeil & Libby Co., of Chicago, were in the city and lost no time in formally taking over the building which the company is to occupy here, the papers all being signed and sealed on March 5.

Ottawa, Ont.—J. W. Curran, of Sault Ste. Marie, Ont.; Mayor Lyons, of Steelton, and Cyril Young of North Bay, have been in Ottawa interviewing the Government regarding assistance in the production of ore, in order to put the steel industry on its feet. In 1913 they state that there was only one ton of Canadian ore used in Canadian blast furnaces out of every 22½ tons used.

Vancouver, B.C.—Work on the large factory to be erected by the Barber Mattress Co. on False Creek, flanked by the G.N. tracks and by Parker and Napier streets and Glen drive, has already begun. When completed, the work of the three factories at present run by the company will be concentrated in the four-storey structure to be built on the new site, according to statement by Mr. Barber.

N.T.R. Shops, St. Malo, Que.—We are advised that work on the foundations of the N.T.R. shops at St. Malo Que., is proceeding steadily, and that tenders for the boilers and power house equipment will be called within the next two or three months. Tenders for machine tools will not be called within at least a year from date, and the completion of the shops will probably not be realized until the Fall of 1916.

Toronto, Ont.—Pollay Brothers, of Belleville, will remove their plant to Mimico, Ont., where they will build a factory for making aeroplanes.

Windsor, Ont.—A tender has been received from the Toronto Furnace and Cremating Co., for a 25-ton incinerator to cost $24,000. The matter is under consideration by the council.

Owen Sound, Ont.—The Doric Cement plant will be sold by auction on April 6. It is reported that a syndicate will buy the plant and operate it during the coming season.

Edmonton, Alta.—Harry V. Shaw, president of the Edmonton Cigar Co., will erect a warehouse and factory building. Magoon & Macdonald, architects.

Montreal, Que.—Daly & Mortin, Lachine, Que., manufacturers of curtain fixtures and moldings, plan to make alterations and improvements in their plant.

Medicine Hat, Alta.—The International Supply Co., Ltd., manufacturers of gas and oil well drilling supplies, will increase the output of its plant. W. R. Martin is managing director.

St. John, N.B.—It is reported that the Sanford Barrel & Keg Making Co., will establish a plant here with a daily capacity of 5000 barrels. It is said that the company will build a chain of factories in Canada. Charles L. Sanford is president.

Montreal, Que.—Plans are being prepared for a new paint factory for the Martin-Senour Co. W. B. McLean, 204 St. James St., is architect. It is said that bids for the construction of the building will be asked about Mar. 1.

Guelph, Ont.—Cowan & Walker have been awarded the contract for the erection of the factory to be used by Sherer & Gellett, of Chicago, counter manufacturers. The new factory will be started at once, and will be situated at the extreme eastern end of the city, close to the C.P.R. and the street railway.

Ottawa, Ont.—A deputation from Western Ontario recently called on Hon. W. B. Nantel, Minister of Inland Revenue, to draw his attention to the necessity of something being done towards the purification of natural gas. A great number of complaints have been made lately about the offensive smell of the gas in Ontario.

Oil Springs, Ont.—The Fairbank interests, drilling for gas about 300 feet south of the Oil Springs Oil and Gas Co.'s workings recently, struck a strong flow at 1,900 feet. When the drill reached that depth the cuttings were blown out and water forced clean over the top of the 60-foot derrick. A. E. Sullivan, of Brantford, is the contractor, who has been working for the Fairbank Company. This well is turning out two million feet of gas a day, and looks as if it might be a permanent producer.

Building Notes

Victoria, B.C.—The Victoria Curling Club is proposing to build a large rink. The cost of building and plant is estimated at $25,000.

Windsor, Ont.—On the casting vote of the mayor, authority was granted by the city council on March 2nd to submit a by-law for the erection of a new market building at a cost of $70,000.

Port Arthur, Ont.—It has been decided to call tenders, award the contract and commence the construction of the new county jail here as soon as the frost is out of the ground. The building will cost about $100,000. The city by-law submitted will give $75,000, and the government has granted $25,000 to its construction.

Wood-Working

Welland, Ont.—A site has been purchased by the Welland Lumber Co., who will build a sash and door factory.

Eganville, Ont.—A sawmill will probably be built here by the Standard Chemical, Iron and Lumber Co., of Toronto.

Quebec, Que.—A sawmill belonging to Joseph Bouchard, at St. Jerome, St. Paul's Bay, was completely destroyed by fire on March 9. Loss, $5,000.

Redcliff, Alta.—The Redcliff Woodworkers have started their planing mill again. This plant has been shut down all winter.

Sudbury, Ont.—The saw mills and office of Foley Bros., at Foley's Lake, have been completely destroyed by fire. Practically nothing was saved.

Kingston, Ont.—At the annual meeting of the Board of Trade on March 3, F. R. Phillips, of Toronto, representing the Reliance Moulding Co., Ltd., addressed the board with regard to moving his plant from Toronto. A by-law was passed last year.

Ottawa, Ont.—The Fraser Mills, above Deschenes, near Aylmer, Que., belonging to J. B. Fraser, or Ottawa, will shortly close down, and several hundred men will be thrown out of work. The reason for the closing of the mills is the fact that the company intends to move the plant up to the Hurricanaw district, near Cochrane, on the Transcontinental line.

Bathurst, N.B.—The Bathurst Lumber Co., of Bathurst, N.B., announce that they have completed plans for the erection of a fifty-ton sulphite pulp mill at Bathurst. Work on this undertaking is to be started at once, organization having been completed. The mills will be operated under the name of the Bathurst Pulp & Paper Co., Ltd., with a capitalization of $3,000,000. Angus McLean, general manager of the Bathurst Lumber Co. will be president of the new concern, while A. G. McIntyre, editor of the Pulp and Paper Magazine and superintendent of the Forest Product Laboratories, a recent graduate of McGill University, will be the manager.

Refrigeration

Windsor, Ont.—The Central Ice & Cold Storage Co., Ltd., is asking the city of Windsor for the usual exemptions and not for free water to make ice. They want only such exemptions as are granted to any manufacturing concern. J. H. Green, manager.

Windsor, Ont.—The new plant which the Central Ice & Cold Storage Co. will build, will be five stories high, of steel and concrete construction. The building will be 800 x 150 ft., and will have a storage capacity of 500,000 cub. ft. The estimated cost of buildings and equipment will be $150,000.

Coquitlam, B.C.—The Coquitlam Ice Co., on Dewdney Trunk Road, contemplate extending their plant, and work is to commence immediately on a new ice house on the rear of the establishment. The added building will cost in the neighborhood of $400.

New Incorporations

The Eureka Rubber & Tire Co., Ltd., incorporated at Toronto, capital $40,000, to manufacture rubber goods at Toronto. Incorporators: John L. Reid, Tom Metcalf, etc., Toronto.

The Port Sydney Land & Mining Co., Ltd., incorporated at Toronto, capital $100,000, to acquire, and develop mines and mineral lands. Incorporators: James Stables, George Alexander, etc., Toronto.

The St. Johns Machinery & Tools Co., Ltd., has been incorporated with a capital of $45,000, and will establish a plant at St. Johns, Que., to manufacture tools of various kinds. Provisional directors are: O. Bard, E. Patenaude, A. N. Deland and others, all of St. Johns, Que.

Shea Sales Co., Ltd., incorporated at Ottawa, capital $50,000, to import, export, and otherwise deal in machinery, etc., at Montreal. Incorporators: John J. Creelman, Gilbert S. Stairs, etc., Montreal.

North Woods Mines, Ltd., incorporated at Toronto, capital $40,000, to acquire, and develop mineral lands and deposits. Incorporators: Gideon Grant, Mervil MacDonald, etc., Toronto.

William Cowlin & Son, Canada, Ltd., incorporated at Toronto, capital £10,000, to carry on the business of builders, contractors, at Toronto. Incorporator: Sydney V. Kendall, Toronto.

The Canadian Peat Co., Ltd., incorporated at Toronto, capital $250,000, to manufacture and deal in peat fuel, and clay products of all kinds, at Toronto. Incorporators: Hugh P. Bell, Michael Chapman, etc., Toronto.

United Motors, Ltd., incorporated at Toronto, capital $50,000, to carry on the business as manufacturers of automobiles, motor trucks and motor vehicles, at Toronto. Incorporators: James J. Kenney, Lloyd C. Loomis, etc., Toronto.

The Keystone Electric Co., Hamilton, Ont., has been incorporated with a capital stock of $75,000, to manufacture automobiles, gas engines, steam engines, etc. Henry A. Burbidge, John R. Marshall, incorporators.

The Motor Finance Co., Montreal, has been incorporated, with a capital stock of $50,000, to manufacture automobiles, engines, etc. Adolphe Kornbloom, New York, N.Y.; Edwin N. Todd, Edwin A. Mumford, incorporators.

Refractory Ore Converters, Ltd., incorporated at Toronto, capital $150,000, to acquire, and develop mines and mineral lands at Hamilton, Ont. Incorporators: James W. Lamereaux, John J. Markham, etc., Hamilton, Ont.

Canadian Union Metal, Ltd., incorporated at Toronto, capital $40,000, to manufacture metal porch columns, and metal furniture, etc., at Galt, Ont. Incorporators: Don C. Barrick, Charles H. Barrick, etc., Canton, Ohio.

The Farrell Engineering Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to carry on a contracting and engineering business at North Bay, Ont. Incorporators—Cecelia Farrell, J. Bain, Mr. Stewart, of North Bay.

The Windsor Power Bldg. Co., Ltd., incorporated at Toronto, capital $100,000, to construct buildings and to do a general warehousing and storage business, at Windsor, Ont.; Incorporators: Benjamin J. Fox, James A. Straith, etc., Toledo, Ohio.

Tenders

Ottawa, Ont.—Sealed tenders addressed to the Secretary of the Department of the Interior, Ottawa, Ont., will be received up to noon, 6th April, 1914, for the supply of 13,500 lineal feet of 20-in. diameter lapwelded steel pipe, and 12,000 lineal feet of 6-in. diameter cast iron pipe for the water system at Banff, Alta. Specifications may be had from the Commissioner of Dominion Parks, Ottawa, Ont.

Railways—Bridges

Goderich, Ont.—Steps are being taken to influence the Provincial Legislature to renew this charter of the Ontario West Shore Railway, which expires on April 13.

Ottawa, Ont.—A bill respecting the Sudbury, Kippewa and Bell River Railway has been passed by the Dominion Railway Committee. It will run from Temiskaming Lake to Bell River on the N.T.R.

Moncton, N.B.—It is reported that plans for a new steel bridge to replace the present wooden structure across the Petitcodiac River at Moncton are being prepared by the Public Works Department at Fredericton and are nearing completion.

London, Ont.—McAllister, Beer & Co., representing Detroit, Montreal and New York capitalists, will apply for a charter to build a new $3,000,000 radial line from London to Grand Bend on Lake Huron and from there to Stratford, and eventually take in Woodstock, Guelph, Galt, Toronto and St. Catharines.

Lambton Mills, Ont.—Divisional Engineer Hertzberg, of the Canadian Pacific Railway, has prepared plans for the enlargement of the overhead bridge spanning the Humber River near here, in order to lay an additional track at this point. This will make a through double track line to Islington.

Toronto, Ont.—Corporation Counsel Geary states that the Private Bills Committee of the Federal Parliament had deferred consideration of the application of the Toronto, Niagara and Western Railway for an extension of time in which to construct their railway in the city limits. The application is likely to be dealt with next week. It is being opposed by the city.

Winnipeg, Man.—Contracts for four bridges, costing between $3,000,000 and $4,000,000, have been let by the C.N.R. These bridges, which are all on the main line west of Edmonton, are over the Snaring, Miette, Athabasca and Pembina Rivers. The substructure of concrete for the first three bridges is now under construction, and it is expected that the steel will be erected during the summer. All these bridges will form part of the Canadian Northern Transcontinental permanent lines.

Granby, Que.—A new railway to be known as the Farnham & Granby Ry. Co is to be built from Farnham through the counties of Brome and Rouville to the town of Granby, Que., and then northeasterly passing through the counties of Shefford to Windsor Mills or Richmond, P.Q., with power to connect with the C.P.R. and the Central Vermont Railway. This is the purport of an application for an Act to incorporate, presented to the Canadian Parliament. This railway will pass through a fertile district of Quebec Province.

Marine

Sarnia, Ont. — A large number of steamers are being fitted out here and at Port Huron for the coming season.

Toronto, Ont.—It is rumored that James Playfair is organizing a company to compete with the Canadian Steamship Lines, on the Great Lakes.

Quebec, Que. — The Galway-Quebec Steamship Service Scheme is tied up for the present, as the provisional directors decline to subscribe more capital until more outside support is assured.

St. Catharines, Ont.—St. Catharines Board of Trade have passed a resolution asking the Dominion Government to deep en the whole St. Lawrence route so that ocean-going vessels can come right to Central Ontario.

Goderich, Ont.—Under Government supervision the lighthouse here is being partially demolished to accommodate a revolving flashlight which the Dominion Government has decided to place there.

Kincardine, Ont.—A big delegation from the town council and Board of Trade left for Ottawa recently to urge the Government to make a real harbor of refuge here and prevent any more big wrecks.

Halifax, N.S.—Plans to build a large drydock are being prepared in this city by the Public Works Department, and surveyors have been sent to determine the exact location of the big dock. As soon as the site is selected, work will at once be commenced and the construction rushed with all possible speed.

IF IT'S MACHINERY WRITE "WILLIAMS"

The A. R. Williams Machinery Co., Ltd., 64-66 Front St. W., Toronto

Goderich, Ont.—It has been arranged for fifteen or more delegates to leave here for Ottawa on March 11 to press the Government to make the necessary improvements to Goderich Harbor. The delegates will occupy a special car.

Ottawa, Ont.—The development of a new harbor at Kincardine was urged upon the Minister of Public Works by a deputation from that town. It was proposed to utilize existing works and others for which money has been voted to provide a new harbor west of and adjoining the present harbor.

Sarnia, Ont.—The Reid Wrecking Company has purchased the wrecked steamer Matoa from the Pittsburgh Steamship Co. The steamer Nicholas was also purchased by the Reids for $6,000. They received in addition $35,000 for salvaging the boat off the rocks of Thunder Bay, near Alpena.

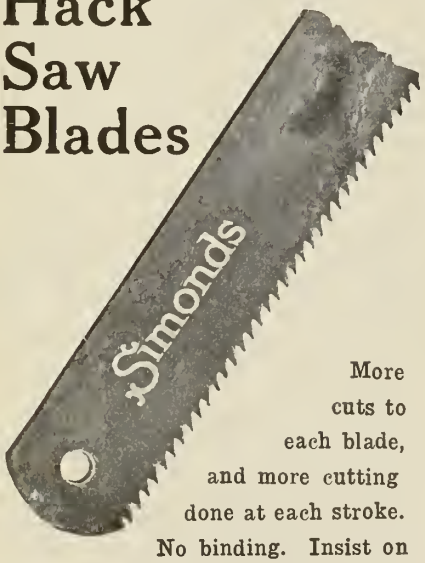
Montreal, Que.—The Canada Steamship Lines have tendered for a first-class mail service which the Federal Government are about to establish on the north shore of the Lower St. Lawrence, extending from the city of Quebec as far down as Seven Islands, where a large pulp and paper plant has been established for some time past.

Ottawa, Ont.—A breakwater is to be built at Leamington within the next couple of years. An appropriation for it will appear either in the supplementary estimates this year or in the main estimates next year. This was what Hon. Robert Rogers told a strong delegation from the North Riding of Essex which waited on the Minister of Public Works recently.

Ottawa, Ont.—Hon. J. D. Hazen says that the Lighthouse Board has decided to place twelve lights and fifteen additional buoys between the Hudson's Bay Straits and Port Nelson as aids to navigation. The steamer Minto will go north as soon as possible to place the buoys. The Minister also stated that an amount in the naval service estimates would be devoted to the erection of a wireless station along the straits.

Sarnia, Ont.—Marine men express the opinion that navigation will open late in April. Many of the officers and engineers of several of the big steamship lines will not start the work of fitting out until April 1. General indications are that ore shipments will be light in the spring and grain will be heavy. Ice conditions all point to a late opening of navigation unless an unexpected warm spell sets in within the next week or two.

St. Catharines, Ont.—The return of Chief Engineer Weller, of the Welland Ship Canal, from Ottawa on Sunday is being followed by the active preparations of the specifications for a new part of section 4 of the big work, to be known as section 4A, between Thorold and Allanburg. On this section there will be one supply weir and two culverts across the dumping ground procured by the Government from the Waterworks Commission of the city of St. Catharines. Tenders will be called shortly. Contractors on the three sections on which construction has been under way are preparing extensively to enlarge their force with the breaking up of the winter.



Toronto, Ont.—An order has been placed with Canadian Fairbanks-Morse Co., of this city, for a new life boat type cabin cruiser, by a well known citizen of Fort William, and it will probably be seen in Thunder Bay about June 1. The new craft has been designed especially for Lake Superior cruising, having a water-tight cockpit and bulkheads to insure a maximum of safety. The general layout of the interior of the cabins will be complete in every detail. The power plant will consist of an eighteen horse power Fairbanks-Morse medium duty type engine and will operate on both gasoline and kerosene.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers. We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time. We can finish steel stampings in Nickel, Brass or Copper. Send us a sample order.

Catalogues

The Canadian General Electric Co., Ltd., Toronto, are distributing No. A4185, which deals with single-phase induction motors, type K.S. A full description is given of these motors, and the illustrations show the details of construction. A diagram with table is included giving the principal dimensions and weight for each size.

Motor-Generator Sets, small types, M.C. and M.C.C., are dealt with in Bulletin No. A4190, recently received from the Canadian General Electric Co., Toronto. Illustrations are given of all the various parts of these machines, and the reading matter describes them in a full and comprehensive manner. The principal dimensions of each size are given on the last two pages of the bulletin.

Direct Current Generators, small belted type, are the subject of Bulletin A4188 issued by the Canadian General Electric Co., Ltd., Toronto. A complete description covering the constructional features of this type of generator is given, together with illustrations of the various parts of the machine. The bulletin concludes with a diagram and table giving the principal dimensions of each size.

The Maritime Motor Car Co., St. John, N.B., have sent us a catalogue describing the motor trucks built by John I. Thornycroft & Co., London, Eng. Each model is illustrated, together with a general specification covering the principal features embodied in the design of these trucks. Tables are included giving the price, code word, over-all dimensions of each model. The catalogue concludes with a list of users and a number of testimonials.

Hydraulic Valves and Fittings are the subjects dealt with in catalogue No. 43, issued by the Hydraulic Press Mfg. Co., Mount Gilead, O. Illustrations are given of an extensive line of hydraulic appliances including operating valves of several types, safety or relief valves, accumulator controls, speed governors, etc. The reading matter is very descriptive and includes several tables on dimensions and areas of hydraulic pipes and other useful information.

The Whiting Foundry Equipment Co., Harvey, Ill., have sent us a copy of catalogue No. 109, describing the foundry elevators which they make. The different types such as compressed air, power geared and electric worm-geared hoisting machines are illustrated and described, tables being included giving the capacities and principal dimensions. Illustrations are also given of two interesting installations.

Brass Foundry Equipment is the subject of catalogue No. 108, recently issued by the Whiting Foundry Equipment Co., Harvey, Ill. The catalogue contains illustrations and descriptive matter of such equipment as brass furnaces, cranes, crucible tongs and tumblers. Tables are included giving the principal dimensions of each size of product.

The E. J. Woodison Co., Detroit, Mich., and Toronto, Ont., have issued a 34-page pamphlet entitled "Firebrick," which contains illustrations and particulars of usual standard shapes of firebrick and some specials. The pamphlet is fully illustrated and contains several pages of useful information on bricks, weights of materials, etc. Copies may be obtained from the Toronto office.

"Van Dorn" Portable Electric Tools are described in Catalogue "A," which has been sent to us by the R. E. T. Pringle Co., Toronto, who represent the Van Dorn Electric Tool Co., Cleveland, O. Some noteworthy features of these tools are referred to, and a brief description is given of each type, which includes a table giving the capacity, weight and speed for different voltages. Each type is clearly illustrated, and includes both drilling and grinding machines. The catalogue concludes with an interesting table giving the machine rating for seasoned wood drilling.

Book Review

List of Boiler Manufacturers.—The Supplymens' Association of the American Boiler Manufacturers' Association announce the completion of their list of boiler, tank and stack manufacturers of the United States and Canada, which is compiled in neat booklet form and contains names and addresses of something over 900 manufacturers. These books are offered to interested parties, such as tool and material manufacturers for the sum of three dollars ($3.00) per copy. Address, F. B. Sloenm, Secy., C|o. The Continental Iron Works, West and Calyer Sts., Brooklyn, N.Y.

How to Build Up Furnace Efficiency, by Jos. W. Hays, combustion engineer, 126 pages, several illustrations and diagrams. Published by Jos. W. Hays, Chicago, Ill. Price, $1.00 post free. This is the seventh edition, revised and enlarged, of a handy little publication devoted to the subject of fuel combustion. It has been written with the idea of showing engineers and superintendents how a reduction in coal consumption can be accomplished in a practical manner. The subject is treated in a scientific, yet at the same time, in a thoroughly practical manner. The reader's attention is drawn to the waste of fuel, common in

More Watchful than the Watchman—

No matter how much you time-clock him;— more effective than the finest fire-fighters are **Manufacturers' Automatic Sprinklers.**

Because they tackle the blaze, when it is in its infancy, and extinguish it before it can become a real fire.

Insurance men are so certain of the efficiency of these Sprinklers, that they back them to the extent of remitting your insurance rates—**nearly 80%.**

That very quickly saves their cost, and you have the added security from the first.

May our representative call and submit prices?

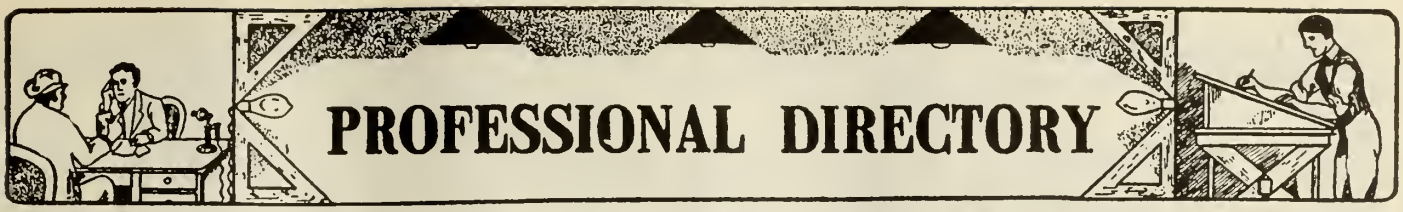
CASTINGS

many power plants, a table on page 7 giving the heat losses in detail, from the coal, at the mine, to the heat delivered at the machine. The book is divided into practically five sections, which may be classified as follows: Why fuel is wasted; how fuel is wasted, how to spot fuel wastes; how to stop fuel wastes, and how to keep fuel wastes stopped. The subject in each section is dealt with fully and is accompanied by diagrams, views of apparatus, etc.



Condensed Catalogues of Mechanical Equipment have been published by the American Society of Mechanical Engineers, New York. This is the third annual (1913) volume of what is really a desk reference book of mechanical equipment, containing, as it does, 330 pages of condensed catalogue material. The purpose of this volume is to present in a concise form such facts concerning distinctive features, sizes, capacities, and special adaptations of mechanical equipment as are likely to be required for purposes of preliminary reference by engineers, superintendents, managers, etc. Practically all the important firms in the United States making power plant, machine shop and contractors' equipment, are represented in this book, one or more pages being devoted to each company for illustrating their principal products. The data is taken from the various manufacturers' catalogues and is arranged in catalogue form in a condensed manner. The arrangement makes it possible to use the volume as a reference book, as further information can be obtained from the usual sources. Both page and classified indexes are included in this book, which is bound in a substantial manner. The illustrations are good and the reading matter well arranged.

Elementary Manual of the Steam Engine, by Ernest V. Lallier, 250 pages, 7¾ x 5 in. 102 illustrations and diagrams. Published by the D. Van Nostrand Company, New York. Price, $2.00 net. This book, as the title indicates, is an elementary manual and is written primarily for students of steam engineering and young men engaged in the actual operation of steam plants. The author's main endeavor has been to present in a thoroughly practical and elementary manner, the use of steam, and give data relative to the operation of steam plants. The first chapter begins with a description of the reciprocating engine and its various parts and its method of operation. A chapter is devoted to the governor feature. Engine horse power is treated briefly in one chapter, but is discussed further in a chapter on the indicator. The chapters on steam and its exhaustive working are comprehensive and will be readily understood. A separate chapter has, however, been devoted to heat, this subject being treated independently of steam. Boilers, water and fire tube, are described at length, 42 pages being devoted to this section, which includes also a chapter on boiler calculations. Steam turbines are described briefly in the chapter on rotary engines, while 28 pages are devoted to a description of internal combustion engines. Other subjects dealt with include Corliss engines, pumps, pipes and fittings, while the last chapter is devoted to lubrication. At the end of each chapter is a series of questions which help to bring out the chief points of the subject under discussion and are a useful adjunct to a work of this description. The book is printed in clear type and bound in serviceable covers. It should be very helpful to those who are beginning to study the many problems associated with steam engine operation, as it is written in a manner so as to be readily understood.

Modern Store Rooms

Economy of production depends upon shop system—that's about all. Orderly methods are the gist of the whole "efficiency" movement.

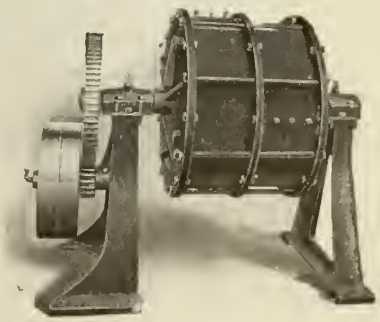
Then why not take the first and biggest step toward lower cost of production by equipping your tool and store rooms with the only means of obtaining order and economy at one and the same time, that is, with

DENNIS SECTIONAL STEEL SHELVING AND BINS

Our catalogue will give you much valuable and interesting information.

The Dennis Wire and Iron Works Company, Limited
LONDON, CANADA

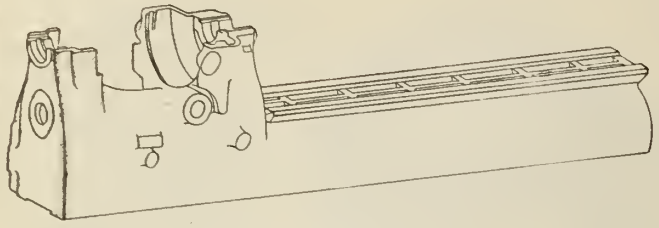
The Abbott Way



is the logical way to finish all your small parts.

Whether they be of brass, steel, nickel, aluminum or any other material, the carbonized steel balls inside an Abbott Tumbling Barrel will give them a smooth, hard, wear-resisting finish—will make them look better than if they were polished—at a fraction of the cost.

The "Abbott" finishes in hundreds, needs no materials except the glass-hard steel balls—which never wear out—and a little soapy water, and requires but a few moments of an unskilled operator's time.



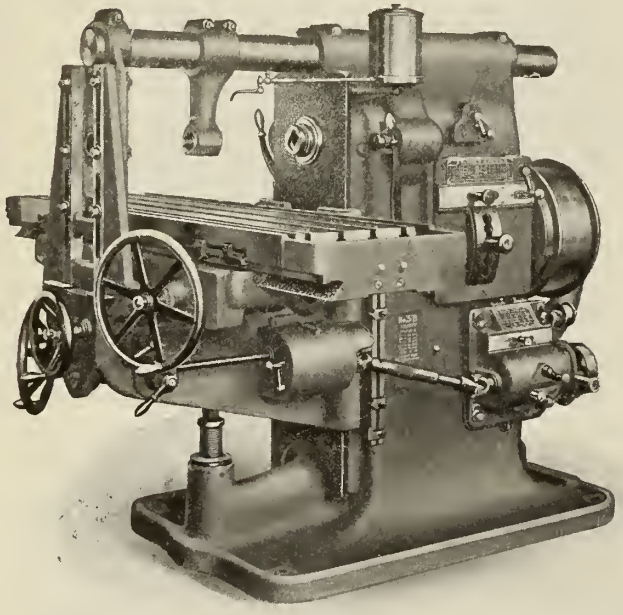
If you're still finishing by the old methods you're wasting time.

You'd better send us some samples for burnishing and write for our free book.

The Abbott Ball Company
1047 Elmwood Avenue Hartford, Conn.

The advertiser would like to know where you saw his advertisement—tell him.

We Saved 4½ Hours on Each of These Castings



This demonstrates the superiority of Milling Machines for this class of work.

Twelve different settings are required in milling the castings, but the facility of making these settings, and the advantages of gang milling and fast operation count in saving time. Furthermore, exact duplicate work is easily obtained by this method of gang milling.

Some work that can be done in this way: machine beds or tables, bases or frames of engines, pumps and compressors, crank cases, etc.

The 5 B Heavy Plain Milling Machine, shown below, is built for just such work.

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

NICHOLSON MADE

THE FILE

THAT MADE "THE FLYER" A FACT

Without a file to smooth the rough edges, the "Mogul" and the "Greyhound" would be mere dreams.

The file has made the "Flyer" a Fact.

And a tour of the shops will convince you that the file was a

NICHOLSON-Made-FILE

Not only the greatest railway shops and shipyards in Canada and the United States—but even the Government railroads of far-off India—are among the largest individual consumers of NICHOLSON-Made-FILES.

And in the interest of economy and efficiency, they are learning to use two files where they heretofore only used one.

The many advantages of the **"use more files"** plan is best displayed by a test in your shops. It will pay well to try it to-day with

WILT

WHEN YOU BUY DRILLS — YOU ARE REALLY BUYING HOLES

The really important question in the buying of drills is—"How many holes per minute of a given size and depth can you make with a dollar's worth of drills?"

There **IS** a difference in drills.

A difference that shows on the result sheet, both in the quantity and quality of work performed.

Have three distinguishing features — Absolute Accuracy — Perfect Uniformity — Exactly the right degree of hardness for the work to be performed.

The fact that Wilt Twist Drills are machined complete at a single chucking is one explanation of Wilt superiority.

Let us tell you in detail some of the remarkable results manufacturers are getting with Wilt Drills. Write about it.

Gears of Every Description

12,000 gear patterns at your service. Undoubtedly just the one you need is among them. We have unequalled facilities for turning out gearing ½ inch to 60 feet in diameter.
Our experimental and research department is continually developing new processes and designs for bettering our product.
Let us know your requirements.

Nuttall—Pittsburgh

Canadian Distributers:

John Millen & Son, Limited

Montreal—Toronto—Winnipeg—Vancouver—Victoria

Address all correspondence to 321 St. James St., Montreal.

You Can Remedy Your Oven Troubles

by getting positive forced circulation, effective insulation, good ventilation and easy control of your temperature. All of these are distinguishing features of the

CRAWFORD

Sectional Oven

¶ Designed and built to improve product and reduce costs, this oven, with its **Enclosed Flame Gas Burner**, has done both for many men in many fields. We are confident we can help you, and ask only that you let us know your troubles.

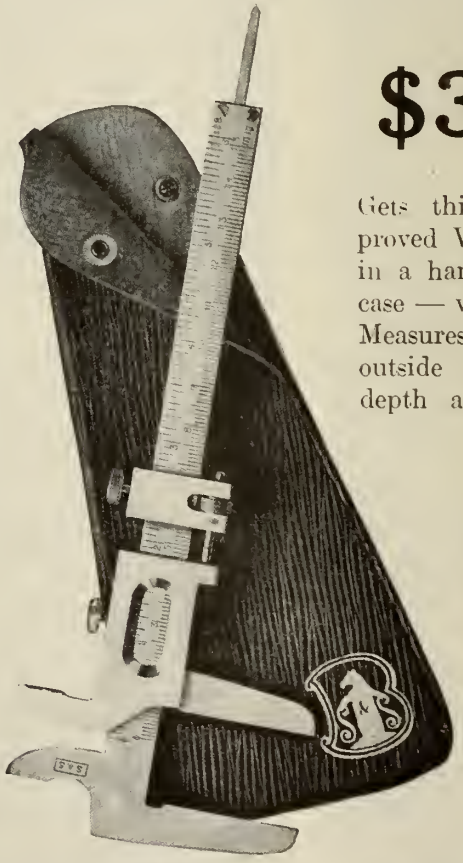
U. S. Electric Drills and Grinders

Save Time, Labor and Money

They can be attached to any lamp socket. For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

3 SIZES.
3-16 inch, W.G.T. 6 lbs.
¼ inch, W.G.T. 9 lbs.
⅜ inch, W.G.T. 12 lbs.



All motors wound for 110 or 220 volts. Direct or alternating current. Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.

½ inch—2 SPEED.
Speed, 400-750 R.P.M.

For Sale By
The Canadian Fairbanks-Morse Co., Limited
Montreal, St. John, N.B., Toronto, Winnipeg, Calgary, Vancouver.

THE UNITED STATES ELECTRICAL TOOL CO.
CINCINNATI, OHIO

$3.50

Gets this S & S improved Vernier Caliper in a handsome leather case — vest-pocket size. Measures inside and outside diameters and depth at one setting.

Send your order in now. Where reasonable quantities are purchased we will stamp with the firm name at no extra cost.

Write for circular. Liberal discount to dealers.

Schuchardt & Schutte, 307 Coristine Bldg., Montreal

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

Tumble For Less And Add To Your Profit

YOU don't need higher mathematics to figure out how

Globe Tilting Tumbling Barrels

save you money. Just start a Globe Barrel working alongside your old-fashioned barrels.

Saves Time in Running.
Saves Time in Filling and Emptying.
Work is Inspected without Stopping the Barrel.

It is the most adaptable barrel made. By changing the angle you get gentler tumbling for small and delicate parts or violent and rapid tumbling on heavy work.

Eight Stock Sizes
List $50 to $170

The Globe Machine & Stamping Co.
Cleveland, Ohio.

Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

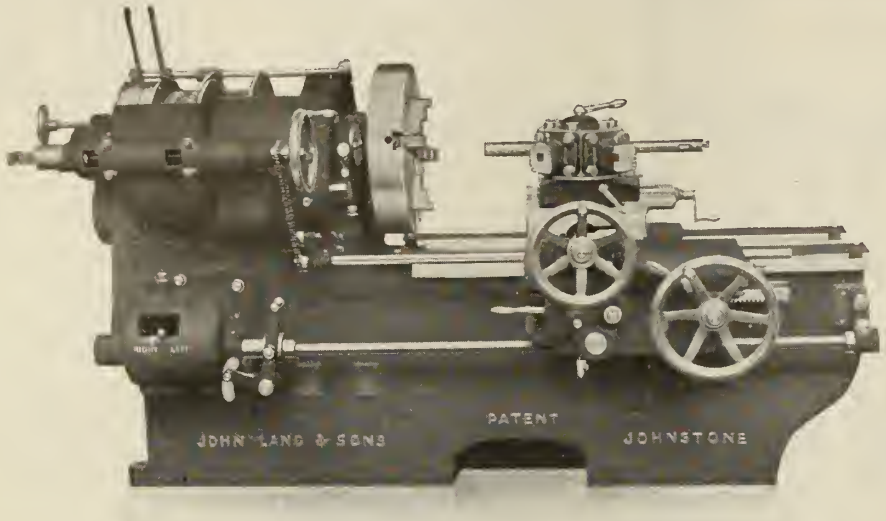
In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.



FREDERIC B. STEVENS
MANUFACTURER

Address Brick Dept.

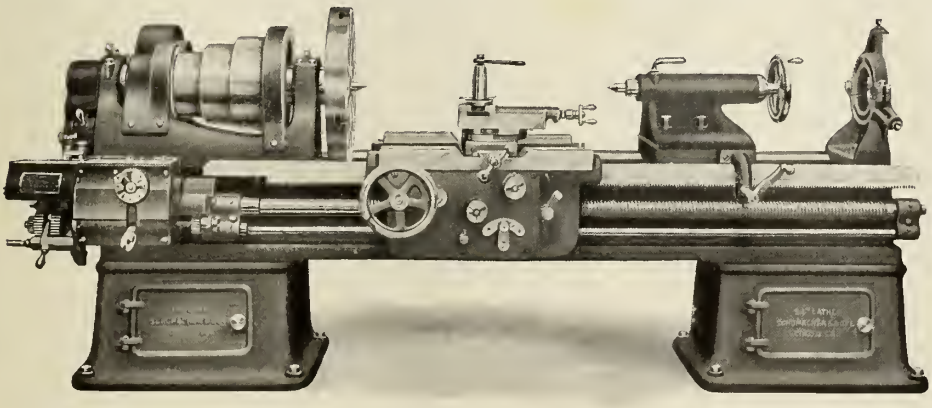
"BUTTERFIELD"

The Name that Assures the

Highest Quality Taps, Dies, Reamers and Screw Plates

Made from carefully selected material and by skilled workmen who have spent years in our service endeavoring to produce the finest tools on the market. Their efforts have resulted in a perfect line of tools that need fear no comparison.

The high quality is also largely due to our special hardening and tempering process that has given our tools a wider field of usefulness and a longer lease of life. A trial order will prove our claim.



Write for details and prices.

BUTTERFIELD & CO.

ROCK ISLAND, QUE. DERBY LINE, VT.

24-inch Instantaneous Change Gear Engine Lathe

Three-Step Cone, Double-Back Gear, permitting of a wide belt at a high velocity for high cutting speeds.

Instantaneous Change Gear Device—all changes for feeds and screw cutting made without removing a gear and without duplication.

Double Plate Apron prevents all overhang and straining of pinions and studs.

(Maximum belt pull transmitted to the cutting tool)

NICHOLSON MADE

To Cut Costs—

To Speed Up Production—

To Increase Accuracy—

USE MORE NICHOLSON-Made-FILES

The proper size and pattern of a NICHOLSON-Made-FILE for a specific class of work, represents the MAXIMUM of filing-efficiency.

To cut filing-costs to the minimum—to increase your output of hand-filed work to the maximum—to insure the greatest accuracy in your finished product

Use MORE Nicholson-Made-Files

One NICHOLSON-Made-FILE will do any given piece of work as cheaply, swiftly and accurately as it can possibly be done with a *single* file. And *two* NICHOLSON-Brands, used where you now use one, will set new records for file-efficiency and economy in *your* shop.

"File Filosophy" gives further details. It is termed by most readers "A complete file education in an hour." We suggest that you send for a **FREE** copy **TO-DAY.**

NICHOLSON-Made-FILES

Brands: Kearney & Foot, American, Great Western, Arcade, Globe.

PORT HOPE, ONT.

Where the Side-Head Boring Mill Is Different

Some of the new features that give increased accuracy, greater convenience to operator and higher production.

Independent Side Head

Side Head is entirely independent of cross rail and can be lowered below table

Side-Head Rapid Traverse

Power Rapid Traverse in either direction is provided for side head as well as vertical head.

Half-Indexing of Vertical Turret

Turret has five tool holders and ten indexing positions. —that is, tools can be indexed halfway between the five usual positions. This feature has proved very valuable on certain classes of work.

Convenient Location of Speed Control

The two speed control levers are located directly below the table, so that operator can instantly obtain desired speed while standing facing his work.

CAPACITY

Swings with side head in position—38 inches, with side head down—44 inches. Maximum from table top to under side of cross rail—26 inches, to turret face—38 inches. Vertical head travels 28 inches vertically. Side Head travels and will turn 26 inches vertically.

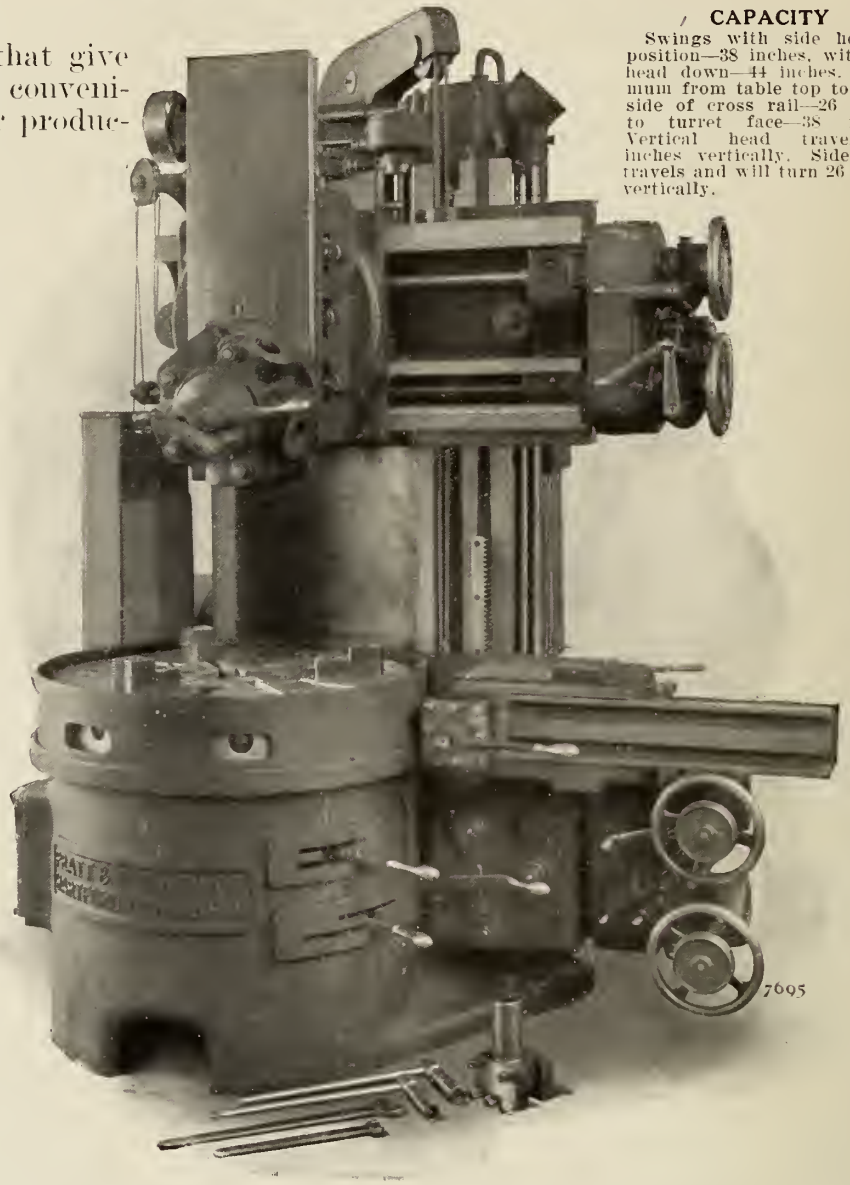

Table starting and stopping lever operates vertically, making it impossible to start machine accidentally. After releasing this lever, from its upper or starting position, it drops by its weight and the table brake is automatically engaged.

Duplicate Lever System

The location and action of the levers for controlling the feed and rapid power traverse is exactly the same on both the crossrail and side head. The operating value of this feature is readily seen.

In engaging feed and fast traverse levers are advanced in direction in which member is to travel.

Extensive Flood Lubrication

Flood lubrication is most extensively used, all feed units, table drive and cross rail elevating mechanisms, as well as spindle bearings, have ample and continuous supply of oil.

Write for new circular "Side-Head Boring Mill."

Garvin Screw Machines

GIVE UNSURPASSED SATISFACTION

The best materials are used in manufacturing these machines. Parts made of Krupp Chrome Nickel Steel, Drop Steel Forgings and Vanadium Steel Springs. Absolutely no steel castings used. Machines can be realigned under all conditions of wear. Spindles are of large diameter, bearings are ground and run in bronze boxes. Cross-slides fitted with plug stops, capable of fine adjustment, and can be lifted from bed without removing turret base. Hexagon Turrets on all machines, except the No. 1. Independent stops to each of the six turret holes. Our turrets and slides have long been renowned for their rigidity without cumbersomeness, the result being large output. The turret momentum is stopped by a solid plug, the lock bolt being used for indexing only. Many other exclusive features.

Garvin Nos. 1, 2, and 2½ Screw Machines, Wire Feed

CAPACITY

		No. 1.	No. 2.	No. 2½.

SERIAL TAPS

For very hard work in tough metal

No. 1, ½-in. U.S.S. Pitch Diameter, .4196-in.
No. 2, ½-in. U.S.S. Pitch Diameter, .4396-in.
No. 3, ½-in. U.S.S. Pitch Diameter, .4501-in.

Note the improved short-thread design—adds to the strength of tap and greatly prolongs its life.

Note the Advantage

Serial Taps are altogether different from sets of Taper, Plug and Bottoming **Taps.**

Tap No. 1 has a full **form** of thread, but **not full diameter.**

Tap No. 2 has a greater diameter than No. 1 but not a full **diameter.**

Tap No. 3 cuts a full **form** and full **diameter** thread. Finishing the incompleted work left by Tap No. 2. It is chamfered only 2 threads.

One cannot be used apart from the set. By evenly distributing the work they produce smoother threads and save tap breakage. Try them on blind holes.

Precision Grinding

Progress determined by the use of

Starrett
Instruments of Precision

The difference between perfection and utter uselessness is represented on some grinding work by an amount so small as to be impossible of measurement except by the most delicate of instruments. The Starrett way on work of this kind is to attach a Starrett test indicator to a convenient holder, such as the scriber of a Starrett Surface Gage, and bring the contact point against the work. The tell-tale needle indicates the exact condition of the work. There is no better way.

You will find many kinds of work in the shop where a combination of Starrett tools will give the most accurate results in the quickest way. Investigate your own particular work and see if there is not some way of getting it done better or quicker.

Send for our big, new, free catalog No. 203, which will help in selecting the proper tools.

Wilt Twist Drills are Making Good

One big bridge building company is getting more than twice the amount of work out of Wilt Twist Drills than they ever got out of any other makes. Wilt Drills are standing up better. They are cutting faster and lasting longer — They are better Drills. A number of big railroad shops are now using Wilt Drills with equally gratifying results.

Wilt Twist Drills are made complete from the rough bar to the finished drill at a single chucking. Note the contour of Wilt Twist Drills. You will see that the groove is so designed as to give maximum strength with perfectly free cutting — The clearance is well defined and accurate. Wilt Drills are better drills.

Ask your supply man. Write for literature.

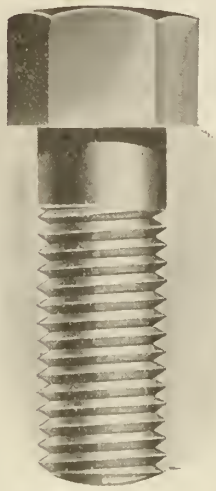
GEAR DATA—

Note Correction of Typographical Error

In Issue of February 26, letter "R" was used in the 5th and 8th paragraphs where "K" was intended. Below is correct form.

Strength of Gear TEETH



From the Hamilton Gear & Machine Co., Toronto

1. From speed and diameter get pitch line velocity in feet per minute = p.l.v.
2. Horse power × 33,000 = P, power in foot pounds per minute.
3. Divide P by p.l.v., giving W, the working load on teeth in pounds.
4. Knowing the kind of material and the p.l.v. (1) get S, the allowable working stress in pounds per square inch from curves in diagram published in our last month's advertisement.
5. Divide W by S, giving K, a strength factor for the conditions of the load.
6. We have already assumed the diameter. Now take any pitch of teeth as a trial and find number of teeth.
7. From the table which we will publish in next month's advertisement, find the value of K for a gear of the assumed pitch and number of teeth and of a face equal three times the circular pitch. This K is the strength factor for the assumed gear.
8. From face = 3 × C.P. for strength factor K (7) find the face needed for strength factor K (5).
9. If this gives a badly proportioned gear with too wide or too narrow a face, try some other pitch or a different diameter.

See last month's advertisement for diagram and next month's for table to use in connection with the above.

Hespeler, Ontario

The Fixed Star of Courage

If a future and greater time develops a superman it will be because courage drives fear from the brain and creates a character that will never give up, but will keep fighting until the world is forced to give in.

¶ Most men are cowards, timid, vacillating, afraid of criticism, afraid to go ahead and get things done. The only devil which now exists is the devil of fear, all other demons having lost both horns and tails. At the point in time where we now are, fear is about the only thing that stands between a man and success.

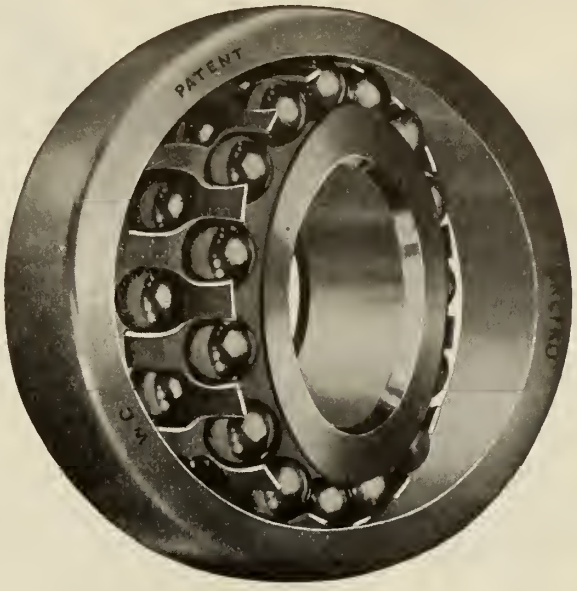
¶ A few days ago a carrier pigeon that had been shipped from Manchester, England, to the city of Toronto, Canada, escaped and twelve days later showed up one morning at the old stand. Had this pigeon realized or studied the uncertainty of a twelve-day flight across the Atlantic such a trip would never have been accomplished.

¶ The courage and fearlessness of this tiny carrier pigeon, flying in the face of wind and storm, in the face of danger from other birds, flying continuously, perpetually for twelve days without food—back across the sea—is a lesson to every man who is looking for an easy job—satisfied to settle down to an eventless, colorless, meaningless existence.

¶ It is courage that will produce the superman of a future and greater time, and the man who drives fear from the brain, who succeeds in washing the yellow streak from his physical and mental character will never give up, but will keep fighting until he forces the world to give in.

¶ It is true that the ambition and courage that abounds in youth makes it possible for a young boy between the ages of twelve and twenty to attempt things he would under no circumstances undertake at a more conservative and at a better-balanced period in life.

¶ Stephen Girard, with one eye deformed, laughed at, mistreated, driven from home by his stepmother at the age of twelve, hiding himself in a merchant vessel starting away to the Indian Ocean, and finally becoming the greatest merchant and financier of his time, is the answer for every man who is about to decide that the 'game is not worth while.'



¶ During the first twenty years of his life, Girard had never known anything but adversity. His life had been filled with enemies and this made it possible for him to appreciate a friend. The Captain of this merchant vessel believed in Stephen Girard, took an interest in him, and from a copy of Voltaire's Philosophic Encyclopedia borrowed from the young Captain, Girard laid the first plans for a store of knowledge that made him one of the best posted men of his day.

¶ George Westinghouse, the inventor of the air-brake, was told by the president of a railroad that he had no time to waste with 'fools who talk about stopping trains with wind.' So if you have tried and failed; if you have planned and then stood by with sad and solemn face to see your plans go wrong—remember that great deeds, vision and a broad knowledge of life and men are the products of courage, and courage is born in the cradle of adversity.

¶ Success will never come by compromise. Your ideals and your purpose must be as fixed, must stand out as clear to you, as a star in the night.

Efficiency

The Skefko Self-Aligning Ball Bearing

is the key to successful bearing operation.

The all-important feature of instantaneous and frictionless self-alignment will be found in but one make of bearings—SKEFKO.

This instant self-adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary bearings, as they are so frequently mounted in swivelling housings. The advantage of having this feature in the bearings themselves, as in Skefko bearings, is plainly seen, as the swivelling takes place upon balls instead of a solid bearing.

SKEFKO BEARINGS eliminate friction, reduce wear, increase the life of machines, and require a minimum of attention and cut maintenance costs to the lowest possible figure.

Skefko Self-Aligning, Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more than ordinary ball bearings. Their use is practical under any load and speed.

Let us show you where Skefko Ball Bearings will save power, lubrication and attention. At the same time they will increase the output of your plant, and the quality of your work.

SKEFKO Bulletins mailed upon request.

The UNIVERSAL GIANT hanger is the ideal hanger for your line shafts. It is fitted with SKEFKO bearings, and delivers the power to the machines with the least possible loss. It accelerates EFFICIENCY.

Canada's Departmental House for Mechanical Goods

Machine Design from the Manufacturing Standpoint

By D. O. Barrett, M.E.

Although dealing specifically with the manufacture of a range of sizes of gasoline engines, this article indicates at the same time, a line of procedure adopted to achieve a definite purpose, and while it may necessarily differ in its detail for the quantity output of other products, there is nevertheless an enunciation of basic principles, the observance and application of which are in conformity with all specialty manufacture.

IN our present day college courses great stress is laid upon machine design, that is, from the theoretical standpoint. This, together with the drawing room practice, occupies a great portion of the student's time. Strength of materials, velocity diagrams, effects of inertia, etc., are treated in much detail. These things are all right in their place and very necessary to proper understanding of certain principles, yet

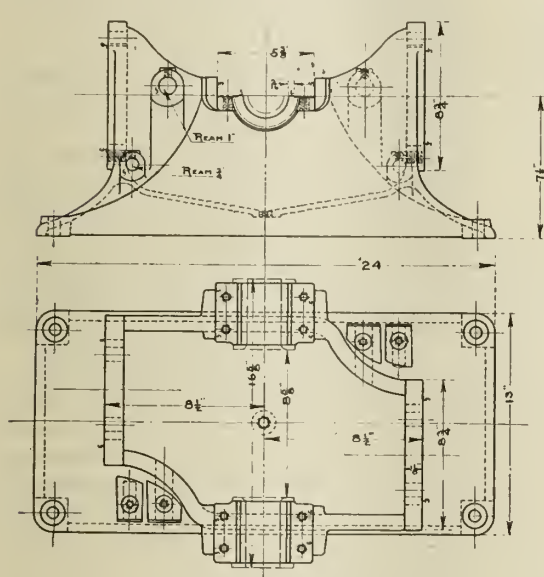

FIG. 1. DETAIL DRAWING OF BED, 6, 8, 10 H.P. SIZES.

how many men who have gone through just that would be capable of producing a machine which, besides being simple and practical could be manufactured at a reasonable cost.

This article will deal with the gasoline engine as a subject, yet the principles here laid down and the application of same can be used in any line of manufacture where machines are built in which the steps are not too great between the various sizes. The tendency of the present day is toward the cheaper class of engines, many of which do the work and last just as long as those whose first cost is much greater. Right here, let it be understood that the word cheaper does not necessarily apply to quality. A purchaser, nowadays, objects to paying for extra polish on an engine or for unnecessary finish of parts whose functions have no direct bearing upon its proper operation.

All the complicated and fancy designs cannot be laid at the door of freshly graduated college students, for we see on the market scores of engines which require an enormous amount of unnecessary handling to finish the heavy parts, while even the small parts are made with a variety of fancy curves which must have given the jig and tool designer, a headache when they were put up to him.

While any refinement which will add to the efficiency of the engine or is a distinct improvement in some way should not be sacrificed simply for the sake of simplicity, yet it is just as easy in designing any of these parts to construct them in such a manner that they may be easily machined and handled, and this especially applies to all hand-fitting, which is always the most expensive work around any machine. Other things being equal, the simplest machine is always the most satisfactory, both as regards its operation and duration of service.

The writer was recently called upon to design a line of two-cylinder opposed engines of the hopper-cooled, or open-jacket type, and while these engines embody nothing really new and are similar in design to hundreds of others now on the market, yet the points leading up to this construction are well worth a little study and thought, not only for their application to gasoline engine design but to other branches of manufacture as well. The writer is familiar with the methods of a well-known machine tool builder whose machines are constructed along similar lines with a great saving not only in the first cost but in repairs and ease in assembling.

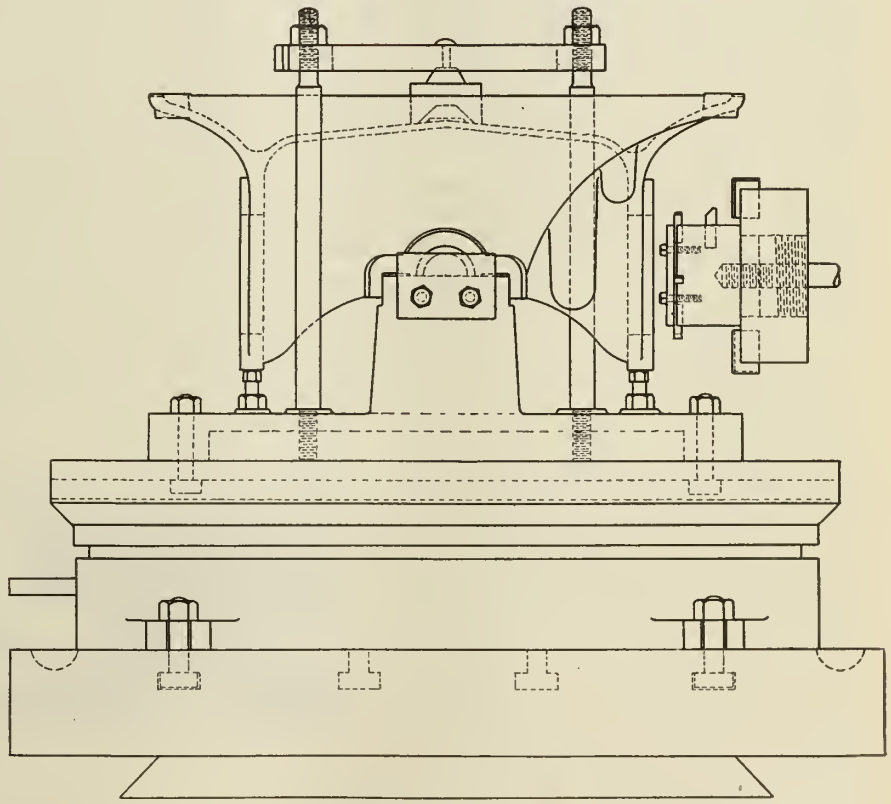

FIG. 2. MILLING THE BEDS.

This firm already had upon the market a line of standard closed water jacket engines of 10, 16 and 25 horse power but due to the increasing demand, found it imperative to bring out an engine of the hopper-cooled type. Being a small firm, and therefore limited, both as to work-

ing capital and manufacturing facilities, the desire was to keep down the number of parts, thus making the cost of patterns, jigs and tools, stock to be carried, etc., as low as possible. The sizes aforementioned had bores and strokes as follows:

Horse power.	Bore.	Stroke
10	5	5
16	6	6
25	7	7

Only the first two sizes will here be dealt with, as it was not the intention to carry the hopper-cooled sizes above 16 horse power.

A careful study was made of the situation, and it was decided to use the crankshaft, connecting rod, piston, and piston rings of the first two sizes, these being the only parts taken from the regular line. The following sizes were then chosen:

Horse power.	Bore.	Stroke.
6	4	5
8	4½	5
10	5	5
12	5	6
14	5½	6
16	6	6

This gave a line of engines of sizes such as are usually demanded by farmers for whom this style of engine is especially suited. These six sizes were divided into two sets—6, 8 and 10 h.p. and 12 14 and 16 h.p. The only difference between the engines of any one set lay in the cylinder, piston, piston rings and flywheel, all the other parts being identical. The same flywheel was also used on two sizes in each set, the 8 and 10 h.p. of the first set, and the 14 and 16 h.p. of the second. Using the different flywheel on the 6 and 8 h.p. served to differentiate the two sizes, otherwise they would have been the same in outside appearances. On the 10 h.p., where the same flywheel was used as on the 8 h.p., the hopper was made higher to give it a correspondingly heavier appearance.

The Necessary Tool Equipment.

Carried along with the design of the engine was that of the tool equipment for the various parts, this being all decided upon before any of the patterns were made. Wherever a machine operation could be omitted or the design changed in any way to facilitate machining, this was done.

Fig. 1 shows a detail drawing of the bed of the 6, 8, and 10 h.p. sizes. To begin with, it will be noticed that the bed is symmetrical with respect to a centre line through the main bearings; thus there is no right or left. In fact, in assembling the engine, there was nothing to determine in which direction the engine should run until the governor and its connections were attached. The results of this will be shown in the method of machining. Stationary shafts were provided for the cam gears and rocker arms, one of each being on either side of the bed.

The Moulding Feature.

To assist the foundryman as much as possible, the bed was tapered both outside and in, there being no overhanging bosses or projections with the exception of the main bearings and the cylinder flanges. Instead of using projecting round bosses for the cam gear and rocker arm shafts, these were filled in

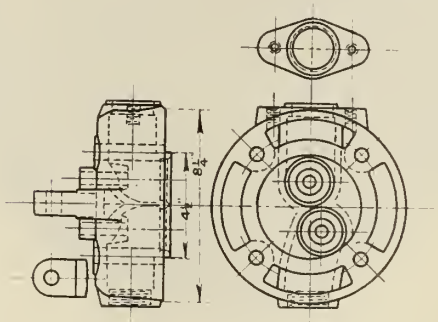

FIG. 3. CYLINDER HEAD.

below so that they would draw straight from the sand without resorting to loose pieces. Loose pieces never retain their proper position and are constantly turning up as missing, as well as having some moulder ram them up and forget to draw them. The pattern was also made much stiffer and the extra amount of iron added was nothing as compared to the probable losses the other way. The projecting parts of the main bearings were attached to a core print extending completely across the bed, this also serving to hold the pattern in its proper shape.

The pattern was rammed up to the top of this print which was then withdrawn with the projecting parts of the pattern and a corresponding core which now covered the open places inserted and the ramming continued. On turning over the cope extended down into the lower part of the base so that no cores were needed there. When the pattern was withdrawn, the only cores to set were those at the end forming the holes for the cylinders. A foot, about 1¾ inches square and about 1-32 inch lower than the bottom of the bed was left at each corner. Ordinarily these required no finishing but, should they come too rough, two men easily handled them on the disc grinder. The ideal grinder, of course, for this job, was one with a horizontal disc on which the beds could simply be set and held by gravity.

The Machining Feature.

The next operation was milling the main bearings. The beds were clamped against an angle plate with two stops bearing against the side to square them up. An end mill was then run through the bearings finishing the sides and the 3-16 inch ridge at the top of the bearings. The distance of this milling from the bottom of the bed was immaterial as no operation depended upon this; in fact everything was measured from the centre of the main bearings. The main bearing caps were also provided with a 3-16 inch ridge which was disc ground, holding same by hand, and then straddle milled to fit the bearings.

Babbitting came next, a split mandril being used and both caps and bed being poured simultaneously. The mandrel had a self-centering device bearing against both sides of the beds on the inside. The caps and beds were then drilled with respect to this babbitting so that they were all interchangeable.

Fig. 2 shows how the beds were milled. The milling machine turret on which these were done was described in detail in the Feb. 6, 1913 issue of Canadian Machinery, the distinguishing feature of which is that one lever operates both the index pin and the clamping device. The beds were turned over and placed on a fixture centrally located on the turret, fitting in the previously milled bearings. Plates bear against the ends of the babbitted bearings, one of them being provided with clamping studs. A slotted bar was slipped across the top with a bearing on the bottom of the oil pan and pulled down by means of the two clamping posts. To eliminate any chatter, screws were run against the beds at the ends and locked. Face milling of the ends was first done, the cutter being set from a milled surface on the fixture (not shown). After facing the one end, the

DOUBLE CYLINDER ENGINE. SINGLE CYLINDER ENGINE.

turret was indexed and the other faced.

The table was now run out and a boring head fastened directly into the face mill, being driven by means of a key and held by a rod extending through the spindle. The hole for the cylinder is 1¾ inches off the centre line of the bed and a stop was provided on the table for this position. The boring head was then run through and the 45 deg. tool at the back allowed to bevel the edge sufficiently so that the cylinders would fit up properly even though the corners were not machined clear out. The table was then run back, the turret indexed, and the opposite end bored without further setting. Both knee and saddle were provided with hinged stops, permitting the setting of the saddle and table so that, after the machine is once set up for the job, there is no measuring to be done.

While these engines have not as yet been produced in sufficient quantities to justify the expense, yet the original tool designs called for a special horizontal drill press arranged to sit on the table of the milling machine to drill, ream, and face the two holes at the side of the bed. A bracket carrying two bushings was to be placed on the fixture on either side of the bed and while the facing of the end was being done, the two holes were to be drilled and reamed through slip bushings, the holes on the opposite side of the bed coming into position when the turret was indexed. The bosses were then to be finished with facing tools provided with adjustable stop collars so as to enable them to be set once for all. In this manner, the major portion of the work on the bed would be done right on the milling machine table and at the one setting, keeping the one operator busy without losing any time. In drilling, the beds were slipped into a jig with hinge bushings for the sub-base hole, and while in this position the holes for the main bearing caps were drilled and tapped, also any other drilling or tapping. The holes for the cylinder studs were drilled under the multiple spindle press.

The engine cylinder was of conventional design as shown by the photographs. Fig. 3 shows the cylinder head which, in order to make one head answer for both ends, had the inlet opening at the top centre and the exhaust on the bottom centre. After facing the end of the head fitting the cylinder, they were slipped into a box jig and entirely completed with the exception of milling the post for the exhaust lever. Both valves were exactly the same. A cast iron manifold elbow fitted into the head, the remainder of the manifold being made of standard pipe and fittings. This manifold would go on from either side and when the engine was completely assembled could be lifted right off by simply loosening the governor connection and taking off four nuts, whereas in the old style engine it was necessary to remove the flywheel on that side, the manifold running beneath the bearing. Placing the inlet at the top of the cylinder greatly assisted in handling the heavier fuels, as these engines would run satisfactorily on kerosene, naphtha, distillate, solar oil, etc. Any fuel that was deposited in the bends of the manifold would flow down into the hot inlet passage of the head and there be vaporized.

The cam was made of cast iron, cast to exact size in an iron chill which acted, both to harden the cam and form to the proper shape. The rocker arm following the cam had a hole drilled halfway through it in which the push rod rested, the whole being held back against the cam by a spring attached to a cotter pin extending through the rod. In assembling the cam gear and rocker arm shafts are driven into the bed, the parts placed on the shafts with the washer and cotter pin at the end, and then further driven in until the washers bear up against the shoulders; this constitutes all the hand fitting on these parts. The main bearings were reamed by using a long bar carrying a reamer at either end two thousandths larger than the shaft, this bar being driven by power and the bearing caps screwed down on the reamer. The only work done on the bearings was to relieve them slightly at the sides, but no scraping was required. Babbitt bushings were used in the connecting rod bearings at the crank end with bronze at the piston end. One-quarter inch play was left at each side of the rod in the piston so as to prevent any cramping.

That portion of the cylinder head projecting into the cylinder was turned 4½ inches on the first set and 5½ inches on the second set. On the 4-inch cylinders the counterbore was made 4½ inches, while the 4½-inch cylinders were bored straight through as were also the 5-inch Of course, on the latter size the projection on the head did not touch the cylinder wall as on the first two, but no bad effects were encountered and the same head did for the three sizes. The spark plugs were placed in the side of the cylinder with the priming cocks directly above. When the engine was warm it would start even when primed with kerosene. The inspection cover over the bed carried the magneto which was driven from one of the cam gears, the coil box being placed just back of the magneto. The magneto, was of the low-tension type, but without distributer, producing a spark in either end at each revolution. One spark then occurred on the exhaust stroke and was wasted, but this helped to keep the plugs clean and also simplified the wiring, doing away with the distributer and making it impossible to get the wrong wires to the spark plugs as is the case when a distributer is used. A large opening with a cover was provided in the centre of the inspection cover so that the connecting rod bearings could be looked after without removing the entire cover.

The engine, in the two-cylinder opposed type, proved so sucessful that it was decided to make single-cylinder engines as well. These were made of the hit-and-miss type, dispensing with the carburetor and magneto, two very expensive accessories. This was necessary in order to get the selling price sufficiently low to compete with other engines on the market. The same cylinder with head complete, exhaust lever and push rod, piston and connecting rod were used on the single-cylinder engine, as well as the cam gear and pinion and the gear and rocker arm shafts and all studs. The crank-shaft was made the same dimensions in the bearings as the double-throw shaft so that the connecting rod bushings need not be changed as well as using the same reamers for the bearings and flywheels.

There were thus six sizes of engines to be made using the existing cylinders. The three sizes from the first set were constructed, but as yet the larger ones have not been, though they probably will be later. Twelve sizes of engines were obtained with a minimum number of parts, the sizes being as follows:

Horse power.	Bore.	Stroke.
2	4	5
2½	4½	5
3	5	5
3½	5	6
4	5½	6
5	6	6
6	4	5
8	4½	5
10	5	5
12	5	6
14	5½	6
16	6	6

The reason that the single-cylinder engines did not give half the power of the double-cylinder was that it was necessary to run them at a slower speed on account of the imperfect balancing. One of the greatest advantages of this construction was the appeal made to the dealer on the question of repairs as one part would, perhaps, fit six sizes of engines such as a valve, cylinder head, or cam gear, the parts most likely to need replacing. For instance, suppose John Jones had a 6 h.p. engine and Wm. Smith a 10 h.p. Jones allows one of his cylinders to freeze and burst by not properly draining same. He absolutely must have power and the dealer does not carry a cylinder and piston in stock and he cannot wait until they come from the factory. So he goes to Smith and borrows one of the cylinders and pistons from his 10 h.p. engine and, by the combination,

he now has an 8 h.p. Or he might also have borrowed a cylinder from either a 2, 2½ or 3 h.p., single-cylinder engine, and they would fit equally well.

In order to show how the various parts interchange and the really few separate and distinct parts necessary to build twelve sizes of engines, the accompanying table has been made up. Similar markings along the horizontal lines indicate that that part was used under those engines:

Illustrations are shown of both the single and double cylinder engines and it may readily be seen that nothing has been sacrificed to make either symmetrical in appearance. The writer was formerly connected with an engine firm in which the engines were all built in pairs, that is, for an 8 and 10 h.p. engine, the only difference would be in the cylinder and piston. On these same engines also, the cam gears from 6 to 20 h.p. were the same for all sizes. These are some of the most successful engines on the market at the present time and are sold in the largest quantities.

The writer has gone into this in some detail because, of course, he is more familiar with engines than any other type of machine. The same principles are, however, adopted by a good many firms other than those building engines, and are well worth some study and thought, the gasoline engine merely showing how these are applied in the design and how they are later carried out in the actual construction of the engine.

STEEL DRIVING BELTS.

WHILE engineers generally have been devoting a good deal of attention to improvements in chain and tooth gearing for transmitting power, says The Engineer, a new system of belt-driving has been introduced in Germany which appears to possess many advantages over some of its older rivals. We refer to transmission by means of steel belts on the Eloesser system.

These belts are made from a specially-hardened carbon steel having a very high tensile strength. The belts vary in thickness, and are made in widths between 1½ in. and 8 in. The tension required is determined with very minute accuracy by a special instrument, and only one flexible steel joint is used. The belts run on flat pulleys, which are covered with a composite layer of canvas and cork. They are only about one-sixth of the weight of leather belts or ropes suitable for transmitting similar powers, and there seems to be no practical limit to the speed at which they can be run.

So far, it has not been found feasible to use these belts with fast and loose pulleys, although they are suitable for employment with friction clutches. Neither is their adoption recommended for cross-belt work where the distance between the centres of the pulleys is less than eighty times the width of the belt, nor for very small pulleys, on account of the bending stresses set up. For continuous drives, however, no matter how close or distant the centres, and either horizontal or vertical, the steel belt has been applied with remarkably efficient results. It is claimed that a steel belt is only about one-third the width of a leather belt for corresponding power, that it does not stretch even with years of work, and, as there is no measurable slip, the transmission is uniform and invariable.

In order to convert pulleys from rope driving to steel belt transmission, a stout steel band is strained round the pulley rim and fastened to a plate fitted into a small cut-out section of the pulley grooves. The smooth surface thus formed is serrated and provided with a friction covering of the kind referred to above. The method of jointing consists of a special clamp mounted on the ends of special clamp is mounted on the ends of the belt, and after the required tension has been applied, the ends are threaded between an upper and lower steel plate shaped to suit the pulley profile until they abut. The clamping plates are then closed by a number of countersunk screws, and soft solder is run into the joint to prevent the screws from slackening. The edges of the belt are rounded off, so that it can be safely handled while running.

The belt is being introduced into Great Britain by the Power Pulley Co., Ltd., Union Works, Manchester, which has already fitted up several large cotton mill drives in the Manchester district on the system with excellent results.

RAIL CORRUGATION AND ITS CAUSES.

By P. W. D'Alte Sellon, M. Inst. C.E.

THE corrugation of rails has become general and serious upon railways and tramways since the introduction of electric traction, and seriously exercises the owners of such undertakings. Investigations organized by many associations in various parts of the world have neither discovered a solution of the trouble nor yet propounded any theory of the causes which has found general acceptance; nor have they suggested any remedy. The object of the paper read recently before the Institution of Civil Engineers, and from which the following abstract is taken, is to put forward the present position for discussion, in the hope that therefrom assistance towards a remedy may proceed. Large expenditure is being incurred by many tramway undertakings in grinding out corrugations, thereby shortening the life of the rails abnormally. It is estimated by the General Manager of the City of Glasgow Tramways that his undertaking spends not less than $50,000 per annum in this grinding operation.

The author is of opinion that the rail-steel now used is not hard enough or

tough enough for its work, and possibly modern methods of steel and rail-making are at fault in this direction. The use of wheels of small diameter is evidently severe on rails, but the conditions of tramway working make alteration impracticable. It therefore becomes necessary to find a material which will not yield to the wheel actions which are the immediate cause of corrugation. Hard rails—i.e., with a high proportion of carbon—are, he believes, essential, and he gives some evidence from his own and others' experience that such high-carbon rails resist the corrugating actions of the wheels, as well as ordinary wear. The British Standard specifications were established before corrugation was realized as a serious possibility, and the range of carbon content permitted, besides being rather wide, only approaches the hard side for Bessemer steel, whilst it is on the soft side for open-hearth steel.

Character of Corrugation.

The general character of corrugation is described, in the paper, stress being laid upon the facts that the "crests" have the appearance of planished or cold rolled steel, and are relatively hard and refractory to acid. The "hollows" are dull, show some lateral detrusion and pitting, and are only slightly harder than the body of the steel. The conclusion drawn is that the "crests" are cold rolled, and the "hollows" are surface which has been crushed, due to the vertical loads imposed by the wheels oscillating about the elastic compressive limit of the steel. How the oscillatory character of the load is brought about is not considered, but it is pointed out that at ordinary speeds the usual pitch of the corrugations on tramway-rails corresponds with a frequency of the order of 100 per second. The difference between this periodicity and that causing the corrugation of macadam roads by motor-vehicles is referred to. The possibility of the rails receiving initial corrugations in the processes of rolling and cooling is briefly discussed, but it is pointed out that such initial corrugation, if it ever exists, is uncommon. Differences of surface hardness or internal stresses received during manufacture are sugested as possibilities.

Leaving these suggestions, the fact remains that corrugation is due to the failure of the rail-table under the stresses imposed upon it. The surface is alternately cold rolled and disintegrated. The measurements of static pressure made by Mr. Worby Beaumont, and set out in the paper he presented to the British Association in 1911, are shown to prove that pressures of such magnitude as to produce destructive effects occur, but that it is probable that the compressive elastic limit of rail-steel is not generally exceeded. The evidence, therefore, seems to show that a comparatively small increase in the compressive strength of the steel will prevent the particular kind of wear under consideration.

Essentials Suggested.

The author suggests that the essential points to be specified are mechanical properties corresponding with the working-stresses imposed upon the rails, and first compressive strength. The British Standard specification prescribes an ultimate tensile strength of 40 tons per square inch. The compressive strength is probably about the same as the tensile, and the actual wear of tramway-rails suggests that it is somewhat in excess of 40 tons per square inch. Probably steel with an ultimate tensile strength of 50 to 60 tons per square inch will be hard enough to resist the destructive stresses, but it is essential that it shall not have a high degree of ductility. The minimum pressure needed to produce surface crushing and flowing should be determined. It is suggested that a Brinell test may give all the information needed. The tup test may have to be modified, but rails laid on a continuous concrete substructure have a large margin of safety against breakage from vertical shocks, and a less severe tup test should suffice. The whole specification of the rail in respect to its mechanical qualities should bear a direct relation to the stress which it will be called upon to resist.

THE DAVIE SHIPBUILDING PLANT, LEVIS, QUE.

GEORGE D. DAVIE, writing to the Montreal Gazette a few days ago, with reference to a report published to the effect that the Canadian Vivkers Company are negotiating for the purchase of the plant of George D. Davie & Sons, Levis, while admitting negotiations are going forward for the purchase of the plant, denies that Vickers are the parties concerned. He says that as there have been a number of reports in the public press with reference to the future of this shipbuilding plant, I would like to state once and for all that I have arranged to take over the interests of the other partners and continue the business under the name of "The Davie Company, Limited," and am now incorporating a company for such purpose. Although some new capital is going in, the plant will continue to be operated and controlled by myself.

Out of Respect.—The plant of the Canadian Westinghouse Co., Hamilton, Ont., was closed all day Saturday, March 14, out of respect for the life and work memory of the late George Westinghouse.

THE FENCING OF MACHINERY.

A REPORT has recently been prepared and issued on "Fencing and Safety Precautions for Transmission Machinery," by W. Sydney Smith, H.M. Inspector for Dangerous Trades and is a document of considerable interest.

Mr. Smith first examines the requirements of Section 19 of the Factory and Workship Act, 1901, which is concerned with the fencing of machinery in factories, and explains that these regulations are not sufficiently far-reaching. He then goes on to deal with various types of transmission machinery, namely, shaftings, couplings, collars, wheels, drums and pulleys, clutches, belts, ropes, and chains. The causation and incidents of accidents are then discussed, and taking the years 1908 and 1909, the causes of the accidents in those years are analyzed in detail. This is done by means of tables, of which the first treats of the various operations being carried out when the different accidents occurred, while the second shows the comparison between the accidents due to loose clothing, hair, etc.

It is seen that, whereas in 1908, 187 accidents (27 fatal) were attributable to these causes, there were 144 (17 fatal) which were not due to clothing, etc. In 1909 the numbers were 165 (30 fatal) and 109 (11 fatal) respectively. It is then seen that in both years the greater number of accidents were due to loose clothing and hair, the actual ratios being 56.5 per cent. in 1908, and just over 60 per cent. in 1909.

The next table sets out the points of contact at which the accidents occurred, such as shafts, collars, couplings, clutches, projecting screws, keyways, belts, pulleys, gearing, etc., and the remaining tables give information concerning the height of the shaft or other machinery causing the accidents, the occupations of the workpeople affected, and the severity of and classification of severe accidents.

Mr. Smith then goes into the question of what he considers should be done in in the way of fencing, and the taking of safety precautions for transmission machinery, and he illustrates his remarks with drawings which exemplify what should not and what should be done. These suggestions he has brought together in an appendix to his report, and it is proposed that, if adopted, they shall be eventually brought into operation as additional regulations. The formal issue of them as regulations is, however, deferred until the users of machinery and others concerned shall have had time to consider the proposals and to submit any observations which they may desire to make.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

FLYWHEEL QUERY SOLUTION.

By "Centrifugal."

IN the March 12, issue of Canadian Machinery there appeared on page 256 an enquiry from H. Westwood as to the stresses set up in the rim bolts and hub bolts of a flywheel 12 feet in diameter, running at 150 r.p.m. and weighing 10 tons. The hub and rim are split, and the hub is held by four 2½-inch bolts, while the rim is secured by four 2-inch bolts. Mr. Westwood states that the initial stress in each of the hub bolts is 1,000 pounds and 700 pounds in each of the rim bolts.

Now, while I believe the following method of approaching this problem to be correct, I do not pretend to an expert knowledge, and hope some fellow-readers who are better up on the subject than myself will send along their solutions for publication.

Formula for Centrifugal Force.

The total centrifugal force (F) in a revolving body expressed in pounds is

$$F = \frac{W \times V^2}{g \times R}$$

Where F=Total centrifugal force in lbs.
W=Weight of revolving body in lbs.
V=Velocity of revolving body in feet per **second.**
R=Radius of gyration of the body in **feet.**
g=Acceleration due to gravity=32.2.

The radius of gyration (R) may be taken as the mean radius of the rim of the wheel. We are not told the size of the rim; but for the purposes of this solution let us assume that the rim is 10 inches deep. Then the mean diameter of the wheel will be

144 — 10 inches=134 inches.

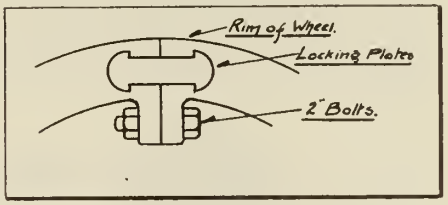
and since R must be expressed in **feet,** we have

$$R = \frac{134}{2 \times 12} = \frac{67}{12} \text{ feet.}$$

Now, the force tending to disrupt a flywheel is not the total centrifugal force (F), but is (F) divided by 3.1416. The case is analogous to that of a boiler shell. Consider a certain length (1 inch long) of a section of a boiler. The total radial forces acting on this length are clearly found by multiplying the pressure of the steam in pounds per sq. inch by the circumference of the boiler in inches, or to put it into a formula:

Total force=P × 3.1416 × D.

Where P=Pressure per sq. inch.
D=Diameter of boiler in inches.



It is, however, well known that the force tending to rupture a boiler transversely is given by the expression, P × D. In other words, to find the force tending to burst the boiler, we divide the total pressure by 3.1416. Similarly in the case of a flywheel we must divide the total centrifugal force (F) by 3.1416 in order to find the force tending to rupture the wheel at its diameter. Thus, the formula becomes:

$$\text{Bursting tendency} = \frac{W \times V^2}{3.1416 \times g \times R}$$

In this formula V is the velocity in feet per second of the wheel at the mean radius of the rim (R). This radius we have assumed above to be 67 inches. The corresponding **diameter** is therefore

$$\frac{67 \times 2}{12} \text{ feet.}$$

This circle revolves at 150 revs. per

FLYWHEEL QUERY SOLUTION.

minute, and its speed per **second,** therefore, is

$$\frac{3.1416 \times 67 \times 2 \times 150}{12 \times 60} = 88 \text{ ft. per sec.}$$

We are now in a position to fill in the numerical values in our formula, the values being as follows:—W=20,000; V=88; R=67÷12=5.68; g=32.2.

The force tending to disrupt one-half of the wheel from the other half is, therefore,

$$\frac{20{,}000 \times 88 \times 88}{3.1416 \times 32.2 \times 5.68} \text{ pounds.}$$

=269,607 pounds, or (say) 270,000 lbs.

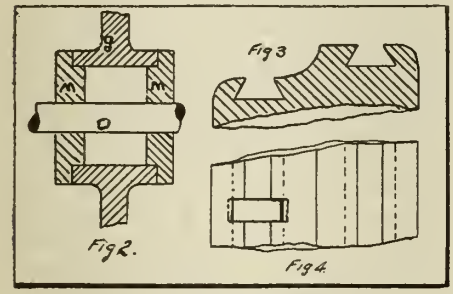
Assuming that the bolts have U.S. standard threads, the area at the root of the thread will be 2,302 sq. inches for a 2-inch bolt, and 3.719 for a 2½-inch bolt. The total area of the eight bolts will, therefore, be a trifle over 24 square inches, and the stress per square inch of area will be

$$\frac{270{,}000}{24} = 11{,}250 \text{ pounds.}$$

Relative Considerations.

Of course, considerable assistance will be given to the rim bolts by locking plates shrunk into the rim on both sides as shown in the sketch; but even allowing for this, it is clear that the bolts are too highly stressed. The trouble is that in the problem, as stated, the speed of the wheel is too high. The speed of the extreme outside edge of the rim is over 94 feet per second. This would be all right for a solid wheel, but for a split wheel the speed should be considerably reduced. Probably 60 or 70 r.p.m. would be as fast as it would be safe to run a well designed split wheel 12 feet in diameter, if made of cast iron.

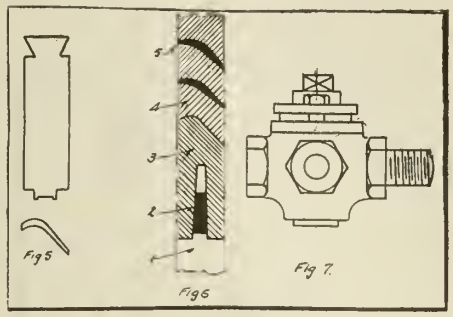
As the centrifugal force varies as the square of the velocity, it is obvious that a reduction of the speed to 70 r.p.m. would greatly reduce the bursting tendency, and consequently the stress in the bolts. The stress in the latter should not exceed about 3,000 lbs. per sq. inch of net section, for in addition to the tensile stress there is a shearing stress on the bolts. If we reduce the speed of the wheel to 75 r.p.m., we shall have cut the speed in half, and the centrifugal force will have been divided by 4. The stress on the bolts would then be only about 2,800 pounds per square inch, which would be in accordance with modern practice.



An objection may perhaps be raised by some readers that the above formula treats the whole weight of the wheel as being concentrated in the rim, and takes no account of the effect of the arms. This is, of course, true; but a complete and accurate treatment of the subject involves the use of higher mathematics, and the formula here given is the one generally employed. It gives a result quite accurate enough for practical purposes. When we consider the severe and entirely unknown stresses set up in the wheel by the cooling of the casting when it comes from the mould, it is obviously useless to figure out the centrifugal stress too closely. In wheels having a comparatively light rim, the bending stresses in the rim, due to the centrifugal force of the portions between two arms, may very possibly increase the calculated stress by 50 per cent.; hence it will be admitted that an approximation to the truth is all that can be looked for, or usefully employed.

TURBINE ROTOR WHEEL BLADING ATTACHMENT.

By H. Womersley.



WHEN blading a turbine casing and rotor, a great majority of the blades have to be put in by hand. The casting blades are all put in by hand, but we have found out a means whereby to blade the rotor wheels mechanically. When it comes to sliding thousands of blades and packing pieces around a 7-ft. dia. wheel, it gets monotonous and tiring. The accompanying sketch shows how to avoid this.

Fig. 1 shows the general arrangement. Brackets (H) (B) (C) support shaft (D), which in turn holds pulleys (E) and (F), also rotor wheel (G). An air cylinder (H) is fitted overhead to provide power for turning shaft (D). Bracket

ROTOR WHEEL BLADING.

(I) is fitted with a butting lever (J) to butt blades into position when wheel revolves. Levers (K) are provided to ease the butting lever, being manipulated from the floor with foot. Brackets (A) (B) (C) and (I) are fitted to bed plate. Fig. 2 shows how the wheel is held in position. The bore of the wheel is approximately 12 in. dia., therefore two pads (M) are used to make up the size from the shaft (D). Pads (M) are held

ROTOR WHEEL BLADING.

to wheel (G) with size ¾ in. bolts, and a key holds them to shaft (D). Fig. 3 shows a section of wheel rim.

Fig. 4 is an outside elevation of rim, and shows how the groove must be cut out to receive blades. Fig. 5 is a view of a blade. Fig. 6 shows method of blading, 1 being groove in wheel, 2 being steel wedge to lock stop, 3 the stop against which the first packing piece is butted, 4 the packing piece, and 5 the blades. Fig. 7 is a three-way cock for regulating air in cylinder; it is fixed to bracket (I). With a little practice on this rig-up, the operator can regulate the face of the wheel quite accurately.

MACHINING GAS ENGINE CAMS.

By R. Bell.

IN a shop requiring a limited number of gas engine cams which had to be made to exact dimensions, the following

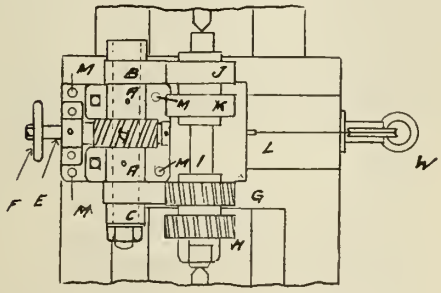


FIG. 1. MACHINING GAS ENGINE CAMS.

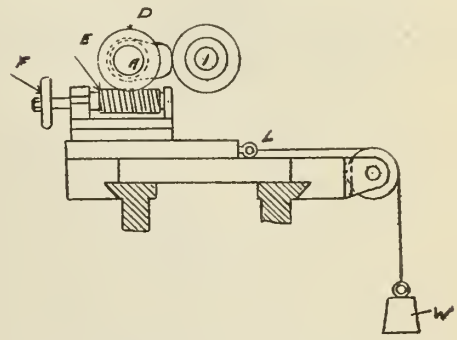
method was devised to machine the profile. It was decided to mill them, and a fixture as shown in Fig. 1 was made to carry out this operation in the lathe. It was arranged to fix it to the top of the cross-slide, the holes (M) being provided for that purpose. The tool rest was removed. Spindle (A) carried at one end a hardened master cam (B), secured to the spindle, while the cam to be machined was put on the other end (C). Previous to this operation the cams had all the other machine work completed on them, the key-way being also cut. A feather in the end (C) at spindle (A) fitted into the cams, by which means the rough cam was located quickly in proper relation to the master cam. On the centre of spindle (A) was secured a worm wheel (D) which meshed into a worm on spindle (E), on the end of which was a hand



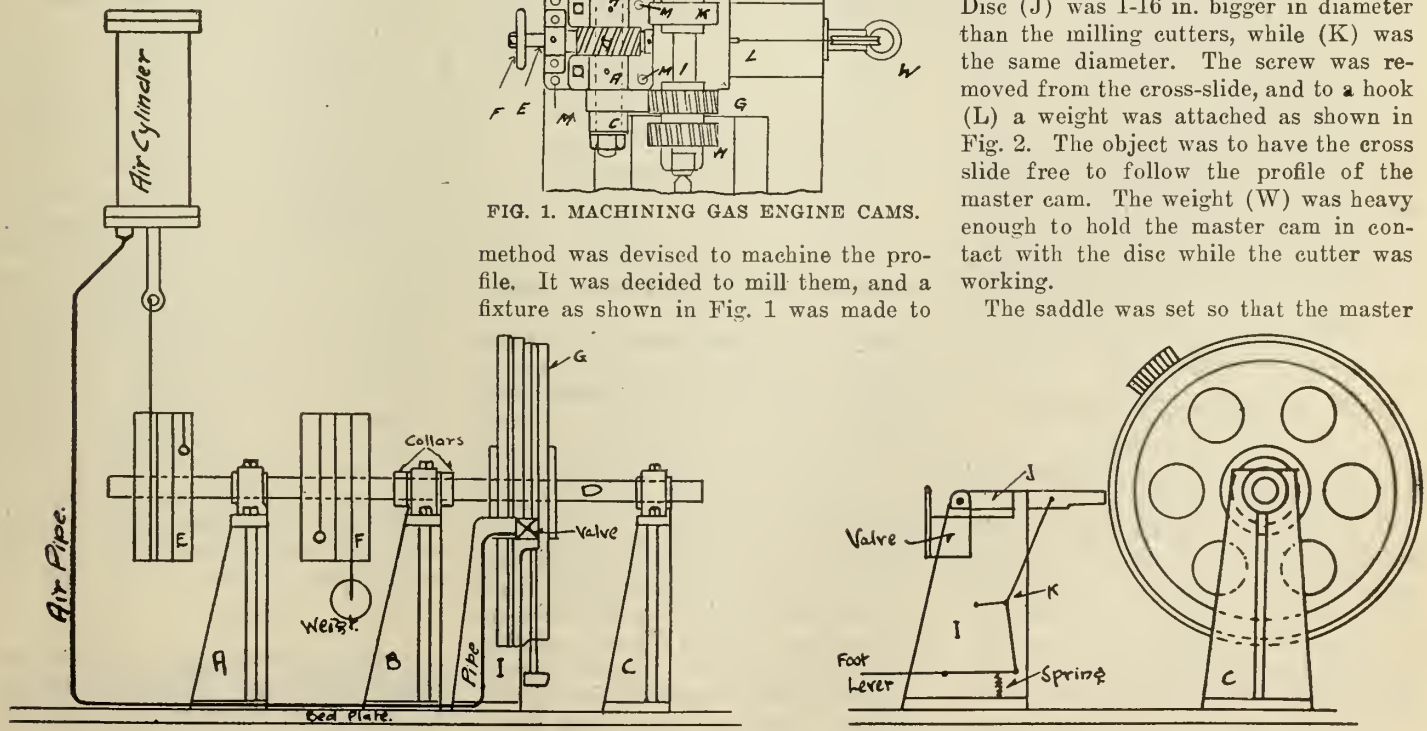


FIG. 2. MACHINING GAS ENGINE CAMS.

wheel (F). By this means spindle (A) could be rotated.

Two milling cutters (G and H) were carried on a mandrel (I) between the lathe centres. These cutters were opposite the cam to be machined. On mandrel (I) were also two discs (J) (K), which were opposite the master cam. These discs were free to rotate on the mandrel. Disc (J) was 1-16 in. bigger in diameter than the milling cutters, while (K) was the same diameter. The screw was removed from the cross-slide, and to a hook (L) a weight was attached as shown in Fig. 2. The object was to have the cross slide free to follow the profile of the master cam. The weight (W) was heavy enough to hold the master cam in contact with the disc while the cutter was working.

The saddle was set so that the master

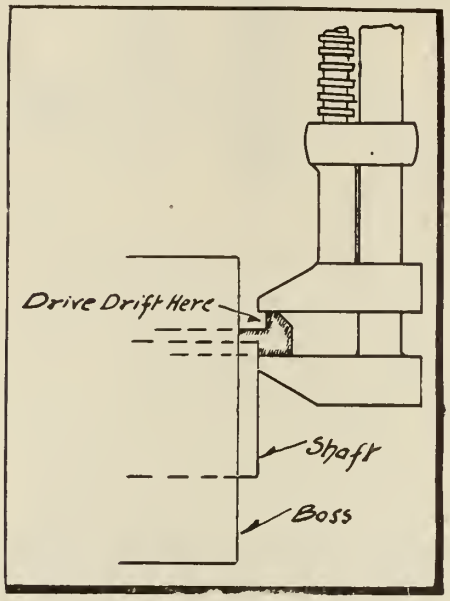
TURBINE ROTOR BLADING ATTACHMENT.

cam was in contact with disc (J) and the cutter start. Spindle (A) was turned by means of the hand wheel F. The master cam as it revolved moved the cross-slide back and forward, the cutter thus machining the rough cam to the same profile as the master cam. After this cut was completed, the cam had still 7.32 in. more material all round than the master cam, due to disc (J) being 1-16 in. greater in diameter than the cutter. The saddle was now set with the master cam opposite disc (K), and the operation repeated. This removed the remaining material, finishing the cam to size. It was found that this method left a better finish than taking all the material at one cut.

PROLONGING THE LIFE OF STEEL RULES.

By D. A. Hampson.

A GREAT many shop men carry steel rules ("scales") in the pockets of their overclothes along with centre punches, screws, and assorted odds and ends. Borrow one of these rules and you will find its edges and corners all rounded over and tapered back, so that the graduations are barely visible at the places where they are most needed. When the owner can stand it no longer he goes and buys a new rule.



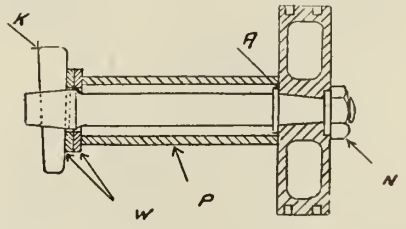
Probably because the manufacture of steel rules is a specialty apart from the general run of shop work, few machinists ever think of doing anything for an old rule. Yet, if there is any sort of a surface grinder in the shop, the round edges can be quickly brought back to their original state of "squareness," as it might be termed. Ten minutes' work on the grinder will put a four or a six-inch rule into such shape that a man can be proud to use it rather than be ashamed.

Steel rules are remarkably cheap, and it is not always advisable or profitable to try to renew their life—particularly if the whole surface is worn so that the marks are dim—but many times it is worth while doing, "and it will help a fellow over until Saturday night, when he can get to a store to buy a new one."

HOW TO PULL A TIGHT KEY.

By C. H. Lloyd.

I NOTICED in the Feb. 5 issue of Canadian Machinery a kink sent in by N. G. Near, showing a method of pulling a tight key. This reminded me of a similar method which I have often used with success. Place a common monkey wrench on the head of the key, as shown in the sketch. Between the head of the key and the wrench drive a drift made of an old file tang or some other piece of steel, and steady the wrench with the hand, so that the key will not bend. The wrench holds the drift in place and prevents it flying out. It will be seen that



REMOVING A TIGHT KEY.

the drift must not be thicker than the height of the head on the key. With this device it is possible to draw very stubborn keys without damage.

REMOVING LOCOMOTIVE PISTON RODS FROM HEADS.

By R. Bell.

THE sketch is descriptive of a good method of removing piston rods from heads. These, when put on, are generally fitted up on the taper to within an ⅛ in. of the shoulder (A). The piston is then heated and the rod put

REMOVING LOCO PISTON RODS FROM HEADS.

in and drawn up to the shoulder by the nut (N). This makes a tight fit, and it is difficult to remove the rod again when necessary. By the method shown, a very tight piston can easily be removed. (P) is a piece of pipe of sufficient diameter to slip over the rod, and of convenient length, as shown, to come within two inches or so of the crosshead key slot. The distance between the end of the pipe and the slot can be made up with washers (W) (W) of suitable thickness, which afford a better surface for the key (K) than would the edge of the pipe. Their use also allows for a little variation in the distance between the piston head and the key slot in different rods. The washers must overlap the inner edge of the key slot so that the key will have a little draw. (K) is a tapered steel key. The pipe and washers are put on, as shown, and the key driven in with a sledge hammer. This method is much quicker and easier than heating the head when a rod has to be removed.

REPLACING GAUGE GLASSES.

By R. BELL.

IN the January 29th issue of Canadian Machinery, one of your correspondents mentions a difficulty he has with gauge glasses bursting after being replaced following cleaning. In the first place, I might ask if it is not rather an unusual practice to remove glasses for cleaning? Blowing a glass through regularly generally keeps it clean. With regard to the glasses breaking, I think this might be explained as follows:

It would be impossible to put in a glass and screw up the packing nuts without setting up strains in the glass in certain directions. A new glass is flexible to a certain extent and allows for these strains. Now, is it not possible that after a period of service, a glass becomes less flexible, and on being replaced after cleaning we may set up a strain in it in a different direction than previously; under these conditions the glass will therefore be very liable to fracture. I have noticed on several occasions that glasses often burst after any interference with the mountings.

HINT TO LATHE MAKERS.

By J. Davis.

I DARESAY every machinist has at some time or other had a shaft or other work in the lathe that required to be marked off for key seats. If there is only one key seat to be marked off it is an easy matter to run a sharp-pointed tool along while the lathe is standing, and thus mark a line parallel with the centres. If two lines be required opposite to each other or at right angles, it is a different proposition, and necessitates quite a bit of monkeying around with a surface gauge or other apparatus. It seems to me that if makers of lathes would mark off the faceplates with about eight lines equally spaced running from circumference to centre it would be much appreciated, and would many times save setting up the job for no other purpose than to mark it off.

St. Thomas, Ont.—Tenders will be received until March 25 for a road oil sprinkler. M. Ferguson, city engineer.

Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

Doubtless some of the elementary work in the first few articles of this series may appear more or less superfluous, but it must be remembered that numerous simple rules and formulae appear from time to time in Technical Journals, which are discarded and dubbed impractical by many operators for the simple reason that the elementals are either unknown or have been forgotten. The purpose of this course will have been achieved if the above tendency is even in part combatted.

INVOLUTION and evolution were explained, and the procedure to be followed in the extraction of the square root of a number was detailed in the concluding section of the lesson in our March 5 issue. In the present instance, extraction of the cube root of a number, and ratio and proportion are the features dealt with.

Cube Root.

The cube root of a number is found in this manner: Suppose we wish to cast an iron sphere which will weigh 266 lbs., what must be the diameter?

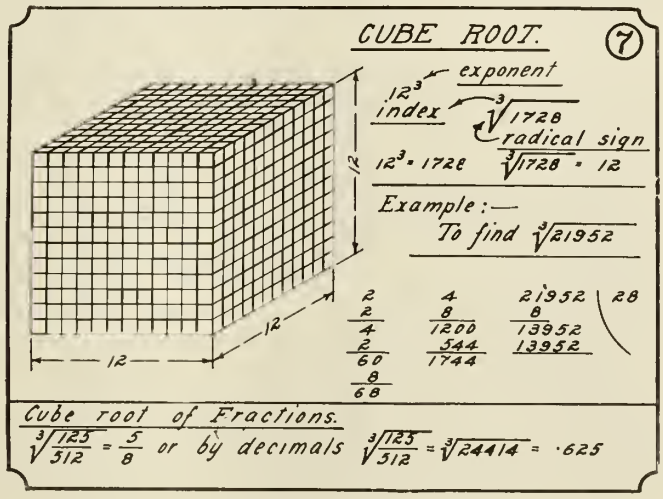
Assuming a cubic inch of iron to weigh .26 of a lb.; then 266÷.26=volume in cubic inches of the sphere=1023.077 cu. in.

To find diameter, use the formula Volume=.5236 d^3, or

$$d^3 = \frac{\text{Vol.}}{.5236} = \frac{1023.077}{.5236} = 1953.928.$$

Then $d = \sqrt[3]{1953.928}$.

Explanation.—Arrange the work in three columns, placing the number whose cube root is to be extracted in the third column. From the decimal point, separate the number into periods of three figures each. Find a number whose cube is less than the first period. Write this figure as the first figure of the root, also at the head of the first column.



One	Two	Three
1	1	1953.928(12.68
1	2	1
—	—	—
2	300	953

3780		
8		
—		
3788		

Multiply the number in the first column by the first figure of the root, and write the result in the second column. Multiply the number in the second column by the first figure of the root, subtract the product from the first period, and annex the second period to the remainder for a new dividend. Add the first figure of the root to the number in the first column for the first correction; multiply the first correction by the first figure of the root, and add the product to the number in the second column. Add the first figure of the root to the first correction to form the second correction. Annex one cipher to the second correction, and two ciphers to the last number in the second column. This is the trial divisor.

Divide the dividend by the trial divisor, to find the second figure of the root; add this to the number in the first column, multiply the sum by the second figure of the root, and add the result to the trial divisor to form the complete divisor. Multiply the complete divisor by the second figure of the root, subtract the result from the dividend, third column, and annex next period to the remainder for a new dividend. Add the second figure of the root to the first column to form the first correction; multiply the first correction by second figure of the root, and add the product to the complete divisor. Add the second figure of the root to the first correction to form the second correction. Annex one cipher to the second correction, and two ciphers to the last number in the second column to form a new trial divisor. Continue in like manner to the last period.

To extract the root of a fraction, extract the required root of the numerator and denominator separately; or change to a decimal, and extract the root of the decimal. (See Chart 7.)

Consistent study of this subject will prove of much benefit to those who have been hitherto unfamiliar with its application.

ARITHMETIC CHART 7.

Ratio and Proportion.

Ratio is the comparison between two numbers of the same kind or denomination, as, 4 is to 8, 120 revolutions is to 180 revolutions, 35 teeth is to 70 teeth; etc. (See Chart 8.) The expression of a ratio is shown in several ways; thus, $\frac{3}{2}$, 3÷2, 3:2 and —. That generally used is the second; 3:2, the above ratios being expressed, 4:8, 120 rev.: 180 rev., 35 teeth: 70 teeth, etc. A ratio may be raised to any power, or any root of it may be taken. (See Chart 9).

Proportion (or the rule of three) is one of the most useful sections of mathematics. It is an equality of ratios, indicated by the sign of equality (=). Thus the ratio of 8:6 is equal to the ratio of 24:18, or 8:6=24:18.

Each ratio of a proportion is called a couplet, and each number is called a term. The first and fourth terms are called the extremes, the second and third are known as the means. In any pro-

portion, the product of the means equal the product of the extremes. A direct proportion is one in which both couplets are direct ratios, while an inverse proportion is one which requires one of the couplets to be expressed as an inverse ratio. Such an expression must be changed to a direct proportion by inverting one of the couplets before solution. The principle of all calculations in proportion is that three of the terms are always known; the fourth being required.

The circumference of two circles vary directly as their diameters, therefore, the circumference of a circle 5 inches in diameter being 15.708 inches; what is the diameter of a circle whose circumference is 23.5 inches?

Expressing the unknown quantity by x, we have

$$5 : x = 15.708 : 23.5,$$

$$\text{Then } x = \frac{5 \times 23.5}{15.708} = 7.48 \text{ inches.}$$

Again, the output of a certain machine being 80 pieces a day; what would be the result if the driving pulley was changed from 15 inches dia. to 18 inches dia.?

$$15 : 18 = 80 : X,$$

$$\text{then } X = \frac{18 \times 80}{15} = \frac{6 \times 16}{1} = 96 \text{ pieces.}$$

In a belt drive, the speed of a certain spindle was 514 revs. per minute. The driving pulleys were 20 in. and 18 in., and the driven pulleys 14 in. and 10 in. diameters. The main shaft has a speed of 200 rev. per minute. Wishing a spindle speed of about 600 rev. per minute, and the only pulleys available being of 20 in. and 12 in. diameter; which one should be used and where, to give the desired result?

The speed of a driven shaft varies directly as the diameter of the driving pulley, or inversely as the diameter of the driven pulley, therefore, the larger the driving pulley, the greater the speed, and vice versa.

Replacing the 18 in. driving pulley with that of 20 in., we get

$$514 : X = 18 : 20$$

$$\text{or } X = \frac{514 \times 20}{18} = \frac{5140}{9} = 571 \text{ revolutions.}$$

Using the 12 in. diameter in place of the 14 in. driven pulley, we have

$$514 : X = 12 : 14 \text{ or } X = \frac{514 \times 14}{12} = \frac{257 \times 7}{3}$$

$$= \frac{1799}{3} = 599 \text{ revolutions.}$$

Then by using the 12 in. diameter as a driven pulley in place of the 14 in., we get the required result.

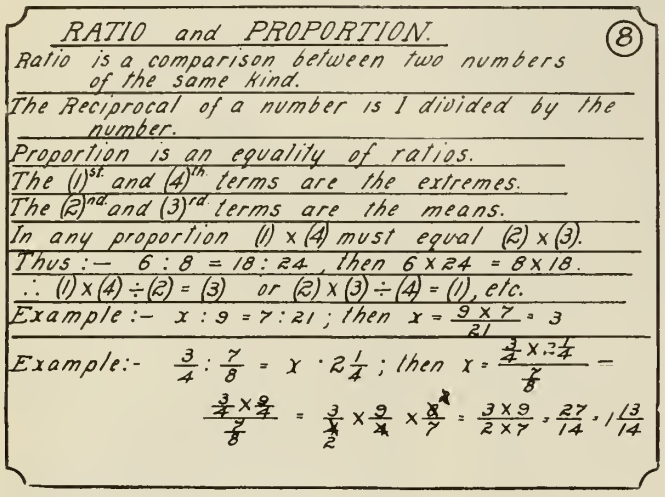
The areas of regular plane surfaces vary as the square of their sides or diameters. (See Chart 9).

A piece of steel 1 in. round, and 4 feet long weighs 10½ lbs.; what is the weight of a bar of 2 in. round and 4 feet long?

$$1^2 : 2^2 = 10\tfrac{1}{2} : X \text{ or } X = \frac{2^2 \times 10\tfrac{1}{2}}{1^2} = \frac{2 \times 2 \times 10.5}{1 \times 1} = 42 \text{ lbs.}$$

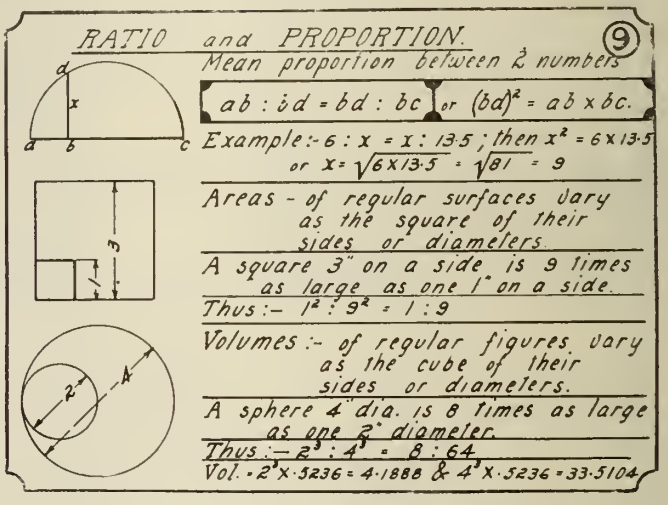
To find the mean proportion between two numbers. (See Chart 9).

The lesser is to the mean as the mean is to the greater of the two numbers.



What is the mean proportion between 9 and 16.

$$9 : X = X : 16 \text{ or } X \times X = X^2 = 9 \times 16 = 144$$



$$\text{then } X = \sqrt{144} = 12,$$

$$\text{therefore } 9 : 12 = 12 : 16.$$

Further remarks may be necessary on the foregoing in the solution of forthcoming shop problems.

ARITHMETIC CHART 8.

ARITHMETIC CHART 9.

QUEBEC HARBOR EXPENDITURE.

AN expenditure of $2,273,559 during 1914 is recommended by the Harbor Commissioners of Quebec in their annual statement recently tabled in the House of Commons, by Hon. J. D. Hazen. The total is made up as follows: Dredging a trench for the proposed quay wall and the channel approach, $400,000; extension to the Louise embankment, together with necessary filling, $952,029; railway terminals for extending the delivery yard accommodation, trackage for the new grain elevator, railway tracks to serve the bulkhead shed in connection with the car ferry terminals, $50,000; purchase of Indian Cove property, required as service ground in conection with works under way, $108,964; for the purchase of four locomotives required by the commission for operating their railway lines, $50,000; to provide grain-loading galleries in the new grain elevator, $500,000 (these will be of fire proof construction, capable of delivering grain to ocean vessels at the rate of 40,000 bushels an hour); to provide ten dock scows for use in the various works, $75,000; for completing the retaining wall at Lampson's Cove for a length of 1,400 feet, $137,565.

Disastrous Results Anticipated.—H. H. Biggert, manager of the International Harvester Co., Hamilton, Ont., says the proposed reduction of ten per cent. on agricultural implements would be almost fatal to the Canadian industry. He said the manufacturers would fight for an equivalent reduction on all raw material.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World

SAYS PROFIT-SHARING IS WRONG

BRITISH employers and workers have not yet got over the shock created by the announcement of the new scale of wages to be paid by Henry Ford to his workmen. It has made the big London firms ask themselves: "What is the secret in a large business of maintaining friendly relations between employer and employed?"

The Foremen Feature.

According to James Pascal, a big employer in the British capital, the answer is quite simple. It lies in the choice of foremen. A good employer, if he be wise and just, will select his foremen with an eye to their moral fitness for the command of men. Much of the trouble in the labor world, although you may not read about it in the newspapers, can be traced back to the bullying manner, or the distinct tyranny of individual foremen; far more injustice is perpetrated by these non-commissioned officers of commerce than the world ever hears about. A bad-tempered foreman creates an evil spirit.

Employer's Personal Responsibility.

"My foremen are my representatives. They distribute the feeling of kindness which I wish to exist, and in cases of dispute, every man and woman, every boy and girl, knows that there is an appeal from the foremen's ruling to the chief; and the foremen know this too. The foremen are not made the final arbiters of a dispute; even the most trusted and honored of our foremen know that in the last resort they must appear with the man in trouble before me or my partners. That is to say, while we exercise the greatest possible care in choosing our foremen, selecting only such men as will encourage the good worker and help to preserve a kindly and a human feeling in the factory, we still feel that the personal responsibility is ours, and ours alone, in seeing that justice is done, justice tempered with mercy, to the least of our employees."

Pay Best Wages.

Pascal does not believe in profit-sharing. His plan is to pay the best wages justified by the business. He has good reasons for thinking that "profit-sharing" is a fine phrase, in too many instances, for obscuring the scandal of unjust wages. On the other hand, there is a social side to the Pascal business in the hands of an able and sympathetic manager. Meals are provided at a fraction over cost price, rooms are set apart for music, billiards and reading, and a home of rest is kept going at the seaside.

Money-Grubbing the Cause.

"My view as to labor troubles," he said, "is simply this: Money-grubbing on the part of employers is the root-cause. Take, for instance, the case of a bad foreman, who spreads an inhuman feeling throughout a factory. Who is really responsible? Is it not the employer himself, who selects such a man in the hope that he will screw the uttermost out of his workpeople? Directly, an employer of labor loses his sense of moral responsibility, trouble begins, and not all the dodges and shifts of intervention can prevent the spread of that trouble.

Must Come to Senses.

"There is only one remedy—the employer must come to his senses and act as a moral being. I am perfectly sure that the worship of money is at the bottom of all social unrest. Men will not distinguish between wealth and riches. They throw away the elementary characteristics of a human being, they may become monsters in their hunger for gain. Now, such an attitude on the part of a human being toward riches is irrational. To a philosopher it must seem madness; to a Christian blasphemy, but to every business man it ought to be patently absurd.

"For what is money? Money is not happiness, but the means of happiness. I regard a dollar as a machine. Too many employers regard their workpeople as machines."

CANADIAN 1913, MINERAL OUTPUT.

A PRELIMINARY report on the mineral production of Canada during the calendar year 1913 has been issued by the Department of Mines of Canada. It shows a value for the year of $144,031,000. Although estimates have been made in some cases where complete returns were not available, it is probable that the final record will be a revision upward. The total value of the production in 1912 was $135,048,000 compared with which the 1913 output shows an increase of $8,982,751 or 6.65 per cent. In view of the large increase over all previous years made in mineral production in 1912, and the general trade depression and industrial restriction experienced during the latter part of 1913, the industry would appear to have made in the aggregate very satisfactory progress. The average production per capita in 1913 was $18.75 as against $18.27 in 1912 and $14.93 in 1910.

Production Since 1886.

The record of annual mineral production in Canada since 1886 shows the rapid growth of the industry, for not only has the total output increased from a little over $10,000,000 in 1886 to its present output, but the average production per capita has increased from $2.23 per capita to $18.57, or eight times the rate shown by the first record.

Year	Production.	Per capita.
1886	$10,221,255	$2.23
1887	10,321,331	2.23
1888	12,518,894	2.67
1889	14,013,113	2.96
1890	16,763,353	3.50
1891	18,976,616	3.92
1892	16,623,415	3.39
1893	20,035,082	4.04
1894	19,931,158	3.98
1895	20,505,917	4.05
1896	22,474,256	4.38
1897	28,485,023	5.49
1898	38,412,431	7.32
1899	49,234,005	9.27
1900	64,420,877	12.04
1901	65,797,911	12.16
1902	63,231,836	11.36
1903	61,740,513	10.83
1904	60,082,771	10.27
1905	69,078,999	11.49
1906	79,286,697	12.81
1907	86,865,202	13.75
1908	85,557,101	13.16
1909	91,831,441	13.70
1910	106,823,623	14.93
1911	103,220,994	14.42
1912	135,048,296	18.27
1913	144,031,047	18.57

The continuance during 1913 of the strike at the mines of the Canadian Collieries (Dunsmuir), Ltd., and its extension to the other collieries on Vancouver Island, seriously restricted the coal output from that district. The total value of the metals was also somewhat smaller than it might otherwise have been because of the slightly lower average prices obtained for copper and silver. A restricted demand was also reported during the latter part of the year for brick and other clay products and structural materials.

While these are some of the influences

that have tended to curtail the mineral output during the year, there have on the other hand been important increases in the production of gold, nickel, lead, amongst the metals, in asbestos, natural gas and many of the other lesser valuable non-metal products and in cement, resulting in the net increases already shown.

Metals Production.

The production of the more important metals and minerals is shown in the following tabulated statement which the figures are given for 1912 and 1913 in comparative form:

	1912.	1913.
Copper	$ 12,718,548	$ 11,753,440
Gold	12,648,794	16,216,121
Pig iron	14,550,999	16,540,012
Lead	1,597,554	1,754,705
Nickel	13,452,463	14,903,032
Silver	19,440,165	18,984,012
Other metallic products	864,343	1,520,072
Total	$ 75,272,866	$ 81,671,404
Less pig iron credited to imported ores	14,100,113	15,543,583
Total	$ 61,172,753	$ 66,127,821

Non-Metals Production.

Asbestos and asbestic	3,137,279	2,849,925
Coal	36,019,044	36,250,311
Gypsum	1,324,620	1,477,589
Natural gas	2,362,700	3,338,314
Petroleum	345,050	406,439
Salt	459,582	491,280
Cement	9,106,556	11,227,284
Clay products	10,575,869	9,673,067
Lime	1,844,849	1,605,812
Stone	4,726,171	5,199,204
Miscellaneous non-metallic	3,973,823	4,384,001
Total	$ 73,875,543	$ 77,903,226
Grand total	$136,048,296	$144,031,047

Of the production in 1913 a value of $66,127,821, or 45.9 per cent. is credited to the metals and $77,903,226, or 54.1 per cent. to the non-metallic products. The increase over the value for 1912 in metallic products was $4,955,068, or 8.1 per cent., and in non-metallic products, $4,027,683, or 5.45 per cent.

There was an increased production of each of the metals except copper and silver, the most important increase being in gold with 28 per cent. Pig iron increased 11.3 per cent. in tonnage, lead, 5.3 per cent. and nickel 10.8 per cent. The falling off in copper was only 1.1 per cent., in quantity, although 7.6 per cent. in total value, and for silver 0.6 per cent. only in number of ounces, and 2.3 per cent. in value, slightly lower average prices having been obtained for these metals.

Amongst non-metallic products increases are shown in all the important products except clays and lime. The largest increse was in natural gas, with 41 per cent. in value. The cement output was greater by 21 per cent. in quantity, asbestos 18 per cent., coal 4 per cent., gypsum 10.5 per cent., salt 6.04 per cent. In the case of petroleum there was a falling off of 6 per cent. in quantity, but on account of higher prices an increase of nearly 18 per cent. in total value. The decreases in clay products and lime were respectively 8.5 per cent. and 12.9 per cent.

Mineral Production by Provinces.

The mineral production by Provinces in 1912 and 1913, is given as follows:

	1912.	1913.
Nova Scotia	$ 18,922,236	$ 19,305,545
New Brunswick	771,004	1,049,932
Quebec	11,656,998	13,303,649
Ontario	51,985,876	58,697,602
Manitoba	2,463,074	2,211,159
Saskatchewan.	1,165,642	899,233
Alberta	12,073,589	13,844,622
British Columbia	30,076,635	28,529,081
Yukon	5,933,242	6,190,224
Dominion	$135,048,296	$144,031,047

The Cement Industry.

On the cement industry the bulletin has the following:

The financial stringency during 1913 had an immediate effect in the restriction of building operations of all kinds and its results are shown in the statistics of production and consumption. In the case of cement, while a very substantial increase in production is shown, this has seemed chiefly to displace imported material, the increase in consumption being only 4 per cent. as against an increased production of 24 per cent. Canadian mills supplied over 97 per cent. of the consumption in 1913 as against 83 per cent. in 1912.

The industry has been marked by the extension of old and the completion of new plants, the latter west of the Great Lakes. The total capacity of completed plants at the end of the year being about 50,000 barrels per day, as compared with 36,500 barrels at the end of 1912. New plants were placed in operation at Winnipeg, Marlboro, west of Edmonton; Princeton, B.C., and at Tod Inlet, Vancouver Island, B.C. The plants of the Imperial Portland Cement Company at Owen Sound and of the Crown Portland Cement Co. were not operated during the year.

The quantity of Portland cement, including slag cement and natural Portland made in 1913 was 8,888,983 barrels, an increase of 1,739,979 barrels or 24 per cent. over 1912. The quantity of Canadian cement sold or used was 8,658,922 barrels, valued at $11,227,284, or $1.29 2-3 per barrel, an increase of 1,526,190 barrels or 23 per cent. and $2,120,728 or 23 per cent. in total value. The total imports of cement were 889,324 cwt., equivalent to 254,092 barrels of 350 pounds each and valued at $409,303, or an average of $1.61 per barrel, as compared with imports of 1,434,413 barrels valued at $1,969,529, or an average of $1.37 in 1912. The total consumption of Portland cement, therefore, neglecting a small export, was 8,913,014 barrels, as compared with a consumption of 8,567,145 barrels in 1912, an increase of 345,869 barrels, or only 4 per cent.

CANADA FOUNDRIES & FORGINGS, LTD.

THE statement of the Canada Foundries & Forgings Co. shows that not only were profits better than in 1912, but substantial amounts were also allowed for repairs, renewals and depreciation. Following is the profits and loss statement, which shows what the profits were, and how they were disposed of:

Profit and Loss.

To depreciation	$ 21,700.00
To interest	4,049.50
To general expense	3,444.16
To written off bond discount	507.00
To written off organization expense	2,405.71
To preferred dividends	67,200.00
To bond interest	4,053.11
To balance	35,220.20
	$138,579.68
By balance Dec. 31st, 1912	$ 25,680.33
By net earnings for 12 months ending Dec. 31st, 1913	112,899.35
	$138,579.68

Big Additions to Plant.

Additions to buildings, machinery and equipment chargeable to Capital Account made during the year amounted to $85,308, the principal items in which are the new steel forge shop at the Canada Forge Co., to replace the wooden structure destroyed by fire, electric cranes, sidings, etc.; and at Canadian Billings & Spencer, a boiler house and boilers, steam drop hammer and accessories. To provide in part for this expenditure, bonds have been issued and disposed of during the year to the amount of $50,700.

In regard to the outlook for the present year, the President, Mr. John M. Gill, says the following, in his annual report:

Outlook Good for 1914.

"The trade depression that set in about the middle of last year is still in evidence, but it is hoped that the arrival of spring will see a return to normal conditions. While our trade in Eastern Canada and for export has been and is

perfectly satisfactory, the returns from the Northwest and the Pacific Coast have been mush below the record of former years. Should favorable conditions be restored west of the Great Lakes, there is every reason to suppose that the year 1914 will be one of average prosperity to our company."

The following is the Board of Directors for 1914: Messrs. John M. Gill, President; J. H. Housser, Vice-President; John H. A. Briggs, Sec.-Treas.; Robert Bowie, Fred. C. Billings, W. H. Comstock, John T. Dillon, William M. Weir, Thomas J. Dillon, J. Gill Gardner, Hon. Geo. P. Graham.

MONTREAL HARBOR 1914 EXPENDITURES.

THE proposed expenditure on the harbor of Montreal during the coming year will be four and a half million dollars, according to the harbor improvements plans, submitted to the Minister of Marine, by W. G. Ross, president of the Harbor Commission of Montreal, and tabled in the House of Commons. It is stated that as the commission has not yet decided on the extent of its proposed railway operations, it has been decided that it will not be necessary to amend the acts in that respect during the coming session. The statement presents in detail the expenditure of the $1,000,000 already granted byParliament, and outlines the following as the programme for 1914:

Continuation of work on elevator No. 2, $808,678; harbor railway system, $282,674; railway equipment, $300,000; Victoria pier and market basin, $293,000; permanent wharf transit sheds, $477,990; warehouse, $200,000; shore wharves, sections 24 to 30, $164,789; amelioration of entrance to Lachine Canal, $50,000; property to be acquired for harbor purposes, Lachine Canal and vicinity, with improvements, $100,000; dredging and filling, $284,738; paving and wharf railways, $150,000; improvement to eastern section below St. Mary's current, floating dock site, $165,000; general improvements and plant, $200,000; permanent sheds, Tarte pier, and equipment, $8,474; Point aux Trembles industrial wharf, $130,0002; wharves and facilities south of Lachine canal, $100,000; industrial wharves, $100,000; St. Lambert-Longueuil road and sewer, $100,000; over-flow dam and bridge for giving connection between Montreal's congested district and the South Shore and access to St. Helen's Island, $50,000; fire-proof office building, $100,000; retiring debentures, $200,000; real estate, $116,605; traffic plant, $192; Aylwin street subway, $50,000; unforseen items, $47,660.

The unexpected balance from previous votes of Parliament amounted to $2,743,571, on January of this year. The proposed expenditure during 1914, 1915, 1916 and 1917, will total $15,000,000, and Hon. J. D. Hazen has given notice of the necessary resolution for providing for advances to this amount.

Trade Gossip

The Jenckes Machine Co., Sherbrooke, Que., manufacturers of boilers, pumps, rock crushing and general machinery, etc., have opened a sales office at 309-311 Confederation Life Building, Toronto, with Mr. P. F. Doyle in charge.

Brompton Pulp & Paper.—The Brompton Pulp & Paper Co. have commenced work on a new iron bridge across the St. Francis River, about six hundred feet below their mills. They also intend building a new paper mill, 476 feet long, extending from the present mill to close to the new bridge. There are about one hundred men employed in building the new bridge, which is to be for the firm's private use only.

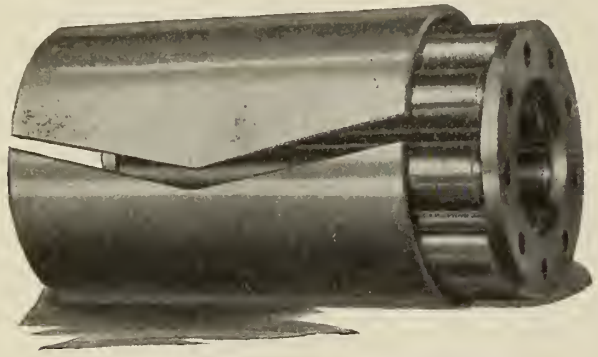
The World's Coal Production.—Information relating to the production of coal in the British Empire and foreign coun the general report compiled by the Chief Inspector of Mines, was recently published. The production of all countries for that year made a total of 1,187,000,000 metric tons, the value of which was estimated at nearly $2,175,000,000. Compared with 1901, the quantity and value showed an increase of 23,000,000 tons and $75,000,000. The three principal producing countries were the United States, Great Britain, and Germany, in order of output, the respective figures being 450,169,000 tons, a decrease of 4,876,000 tons; 276,255,000 tons, an increase of 7,579,000 tons; and 234,521,000 tons, an increase of 12,446,000 tons.

Canada Iron Corporation.—"It was a gigantic undertaking for a young country like Canada. I am afraid that while the management may have been competent enough for an ordinary size business, it was entirely inadequate for an undertaking of this size." This was the opinion of Lawyer Payne, who met on March 6 the bondholders of the Canada Iron Corporation, now in liquidation, and told them the result of his negotiations in Montreal. The undertaking was floated in 1908, and owned foundries, blast furnaces, and mines in various parts of Quebec and Ontario, the idea being that the mines should supply the furnaces and so forth. However, the mines were a considerable distance from the furnaces, and the transportation of ore proved a very costly affair. Payne advised the bondholders to pin their hopes to the foundries, which had made a profit of over $106,000 in the last four months. Some new capital was absolutely necessary, as $600,000 worth of material was now in the grip of the banks for money lent. He thought a million dollars at the outside should be raised. The meeting appointed a committee of inspection.

U.K. Pig Iron Production.—The following preliminary figures have been issued by the British Iron Trade Association, showing the pig iron production of the United Kingdom for 1913, as compared with the four preceding years:—

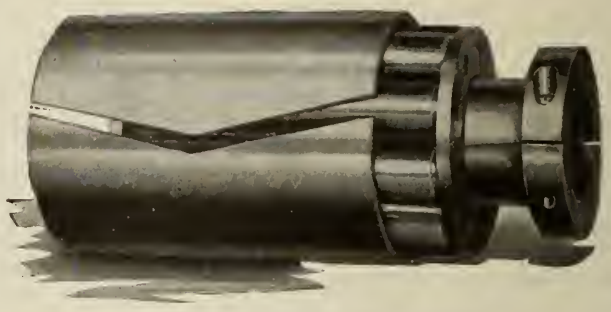
Year.	Tons.
1913	10,479,171
1912	8,889,124
1911	9,718,638
1910	10,217,922
1909	9,664,287

Trade With United States.—According to figures just made public by the Trade and Commerce Department, covering Canadian trade for the past calendar year, the United States still provides the chief source of increase in Canada's annual trade growth. During 1913, imports from the United States increased by $39,026,515, while exports to the United States increased by $23,261,296. This makes a total trade increase with the United States during the year of $62,281,811. As compared with this, imports from Great Britain increased by $6,477,256, while exports to Great Britain increased by $47,811,856, or a total trade increase with the mother country of $54,289,112. The total trade with the United States during the year was $634,653,973, consisting of imports to the value of $441,302,354 and exports to the value of $193,351,619. The total trade with Great Britain was $364,326,938, consisting of imports to the value of $139,811,893 and exports to the value of $224,515,045. The aggregate trade of Canada for the year was $1,147,648,243, as compared with $1,023,641,142 for 1912.



Reduced Coal Output.—The Intercolonial Co. output for last year was the smallest since 1889, and 37,267 tons smaller than that of 1912. The output has been falling off for years as a result of increased cost of production; as a consequence the company has been losing money. The company was recently reorganized. It held its annual meeting in Montreal recently, but, pursuing the policy of many years, no figures were made public beyond the output. Under the reorganization and management of Mr. Chas. Fergie, better things are looked for. The output of coal and coke for the year 1913 amounted to about 200,000 tons compared with 235,857 tons in 1912. The following were elected directors for the coming year:—Messrs. D. Forbes Angus, K. W. Blackwell, Chas. Fergie, James Floyd, R. MacD. Patterson, E. Goff-Penny, and R. W. Reford.

DEVELOPMENTS IN MACHINERY

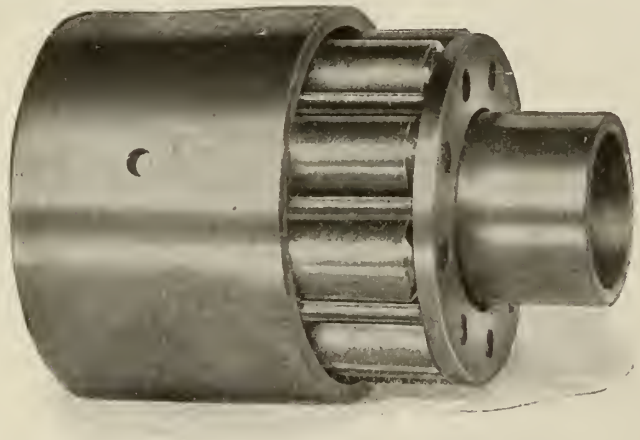


A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

NEW LINE ROLLER BEARINGS.

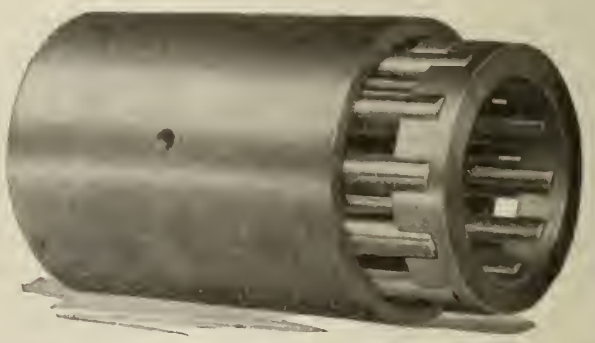
A NEW and complete line of roller bearings, incorporating several new features, has recently been placed on the market for service in many forms of journal roller bearings. Every type of this line appears to bear the stamp of a careful analysis of the many conditions to be faced. A study of the accompanying illustration reveals several interesting points, chief among which seem to be ease of application, absence of roller friction, and a design that points to long bearing life.

TYPE OF NEW LINE ROLLER BEARINGS.



TYPE OF NEW LINE ROLLER BEARINGS.

These bearings embody the basic principles of the successful types of line-shaft bearings that the Royersford Foundry and Machine Co., Philadelphia, Pa., have been marketing for a number of years. A saving of at least twenty-five per cent. of the friction load is, we understand, guaranteed by the manufacturer, and it is reported that in many instances much higher savings have been made; which points to augmented capacity or a cheaper rate of production per machine that has been equipped. Instances are cited where a power plant which has been overloaded in driving machinery equipped with babbited bearings has run below capacity, after the substitution of these types of roller bearings.

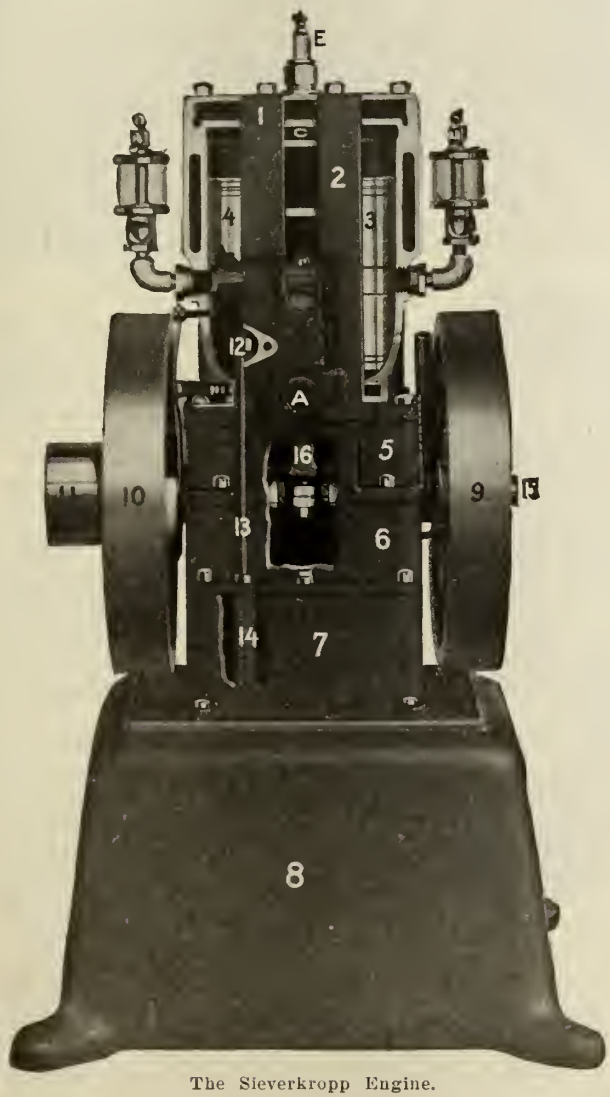


The line consists of five distinct types, four of which are for use in machinery, and one in heavy wagon hubs. The first, known commercially as the "Sells Special," has a shaft-protecting feature in a split sleeve which is clamped over the shaft by two split collars. Ease of application, assurance of fit, and low-cost protection given the shaft, are advanced as prominent advantages. One of the best power-saving points in these bearings seems to be the suspension of the rollers in a permanent, revolving roller structure that keeps them constantly parallel to the shaft, and out of contact with each other; the principle being, that under such conditions, the rollers do not jamb, or become tapered; aside from the fact that their separation is said to add much to the total reduction of friction.

The entire structure is enclosed within a high-carbon steel single-piece, or "Unit Lining, which takes the action of the rollers and prevents wear of the housing. The "V" cut shown in the illustrations is to provide a diagonal joint that allows the rollers to pass over it smoothly. Another type, intended for work similar to the "Sells Special" is known as the "Sells" Commercial Type. It is actually a duplicate of the former, minus the split sleeve and collars. This bearing is said to be especially suited for journals of mine, industrial, or other light-ear axles.

Two other types, designed for high-grade machinery involving heavy loads or high speeds, are the "Sells" High Duty and "Sells" Journal Bearings. They do not differ in principle, but vary somewhat in the design of the roller structures, largely because the shorter length of the former requires rollers of larger diameter to give the same capacity as the latter, with its longer rollers. Where space is not a factor, they are said to perform equally well in a given service, but where the available bearing length is limited, the high duty are recommended. They are generally used in connection with ground sleeves and casings, and for protecting the shaft and housing, when these are not specially selected for direct contact with the rollers.

TYPE OF NEW LINE ROLLER BEARINGS.



TYPE OF NEW LINE ROLLER BEARINGS.

THE SIEVERKROPP ENGINE.

THE gasoline engine here illustrated has many features of interest to users of small power units for operating cream separators, small air compressors, feed grinders, etc. It is an entirely new type of two-cycle engine.

Referring to the illustration, it will be noticed that there are two pistons (3 and 4), acting on one connecting rod (16). The tops of the two cylinders are in communication with each other by means of the passage (C). As the pistons move upwards from the position shown in the cut, they create a partial vacuum in the airtight space below. When the intake port (12) is uncovered, air rushes in, creating a suction in the fuel pipe (13). As the gasoline arrives at the end of the suction pipe in the neck of the mixer, it is immediately atomized by the passing air and becomes thoroughly mixed with it.

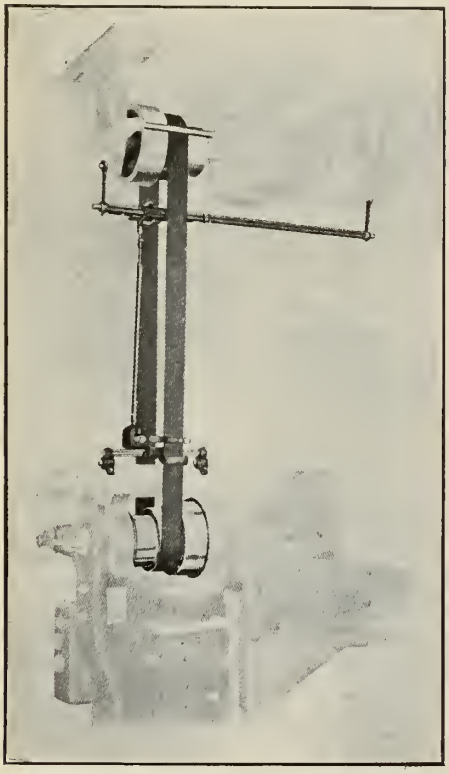
The Sieverkropp Engine.

The two cylinders are entirely cut off from the crank case, but are connected at the bottom by a channel or passage (A). The mixture thus fills the space under both pistons and also the insides of them. It does not, however, fill the crank case. As the pistons start on the downward stroke, the mixture intake port (12) is covered by the piston (4), which traps and slightly compresses the mixture until the piston (3) uncovers the intake port in the right-hand cylinder, when the mixture at once rushes in and fills the upper ends of both cylinders.

The inrush of the new mixture into the right-hand cylinder drives before it all of the remaining burnt gases through the passage (C) into the left-hand cylinder and on out through the exhaust port, which opens just before the intake port. Immediately the pistons start on the upstroke, the intake and exhaust ports are covered, and the fresh mixture is trapped in the top of the cylinders and compressed into a very small space in the cap. Just as the pistons reach the highest point, the compressed charge is fired by the spark plug (E), and the explosion that follows drives the pistons downwards, completing the cycle.

Before the pistons reach the lowest point of their stroke, the exhaust port opens, allowing the burnt gases to escape through the muffler. The intake again opens and the new charge of mixture which has been brought in on the previous up-stroke and partially compressed under the pistons, rushes into the upper parts of the cylinders, and the same action as previously described takes place.

It will be seen that, unlike other two-cycle engines, the charge is not compressed in the crank case, where it is impossible to avoid leakage at the bearings; but is compressed entirely in the airtight chambers below the pistons. The builders claim a very low fuel consumption for this engine, which has been put on the market to fill the needs of farmers, small machine shops, motor garages, dairies, etc. It is said to be so simple that a woman or child can operate it. It is at present being built in small sizes only—½ h.p., 1 h.p., and 1½ h.p.; but the makers are now getting out designs and patterns for higher powers. They are also working on an engine of this type for motor boats.



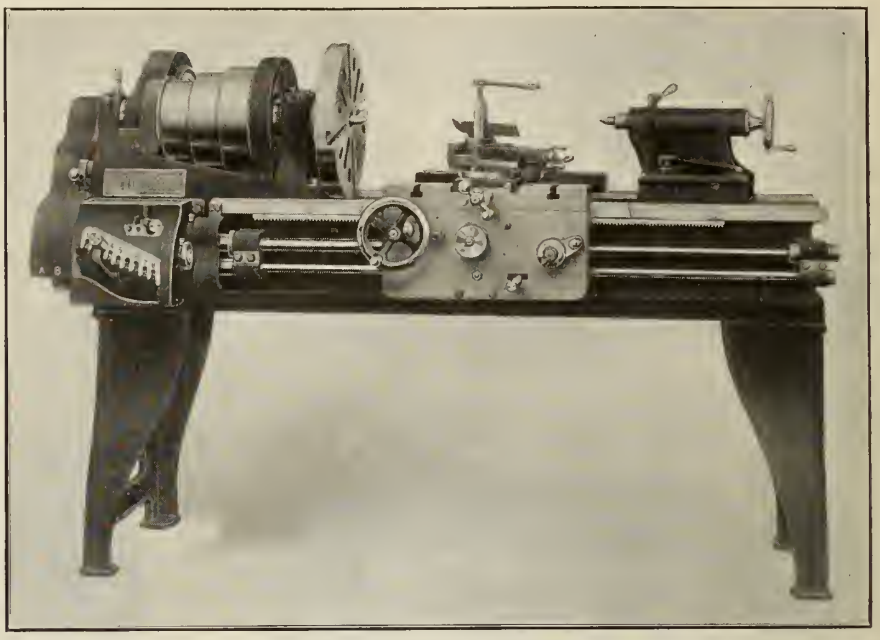
The Foss & Hill Machinery Co., Montreal, are sole Canadian distributors for the Sieverkropp engine.

LEBLOND BELT SHIFTER.

THE "LeBlond" belt shifter device consists of two relatively fixed sections of rack—one mounted on the headstock, and the other on the countershaft. A belt-shifting bracket is mounted on each of these racks and operated by means of a pinion with two teeth, which engages the rack and moves the two brackets in the same direction, one in advance of the other. The rack teeth are spaced one-half the width of the cone step, so that one complete revolution of the pinion moves the shifter bracket the full width of the cone step. A common crank, conveniently located, operates both pinions through a pair of mitre gears and a telescopic shaft, adjustable within certain limits for the height of the ceiling. One shifter always acts one-half revolution of the crank ahead of the other. The first half revolution moves the belt from a large to a smaller pulley on one of the shafts, the next half revolution moves the belt on to a larger pulley on the other shaft. When running, the crank always assumes the same position, convenient to grasp, the belt being locked against further movement except by turning the crank. A stop is provided in both directions to prevent the belt being thrown entirely off the cone. The belt is much longer lived, as the edges cannot curl up against the step of the cone. Wider belts can be used for the above reason, even to the full width of the step. This means greater driving power.

The speed changes are accomplished without effort on the part of the operator. A single revolution of the crank makes the speed changes as rapidly as the gear shift of an automobile transmission. The device converts any cone-driven machine tool into a quick-speed change mechanism, and places the cone-driven machine on the same plane of operating efficiency with the all-geared construction at a much lower initial investment and upkeep cost, while the operator is insured against any possibility of injury in shifting the belt. A simple turn of a crank conveniently placed changes the speed without stopping the cut or touching the belt. It being easy to shift the belt, the operator will change the speed to suit the work being done, instead of running both roughing and finishing cuts and different diameters at the same speed, as is often done. When facing with the cross-feed, the speed can be increased as the cut approaches the centre, keeping the proper cutting speed at all times.

This belt shifter is a product of the



LE BLOND PATENT BELT SHIFTER.

R. K. LeBlond Machine Tool Co., Cincinnati, Ohio, and can be adapted to any make of lathe, miller or drill.

16-INCH QUICK-CHANGE GEAR LATHE.

THE 16-inch quick-change gear lathe with three-step cone and double-back gears, here illustrated, is a product of the Von Wyck Machine Tool Co., Cincinnati, Ohio, who make engine lathes an exclusive specialty. Heavy construction, high finish and accurate fitting are leading features, all parts being made to standard jigs and gauges, and interchangeable.

16-INCH QUICK CHANGE GEAR LATHE.

The quick-change gear box is made as a single unit and is reckoned fool-proof. It contains 14 gears, all of steel, cut from the solid bar, and has but two operating levers, by which all changes are made without duplication. It is arranged with a large quadrant, which allows any odd pitch or metric threads to be cut. The headstock is massive, and has long bearing on bed. The spindle is of high carbon hammered crucible steel, accurately ground and running in large phosphor bronze boxes. The cone pulley is turned and ground to run absolutely true.

The carriage is heavy, well-ribbed, and has four bearings on bed. It is drilled in rear for taper attachment, which can be mounted at any time. A chasing dial permits threads to be chased without stopping lathe or reversing lead-screw, and allows two forward speeds on countershaft. The apron is of double plate type, with all gears and pinions of steel, and cut from the solid with special cutters. A non-interfering device is provided, making it impossible to simultaneously engage feeding and screw-cutting mechanism. The compound rest is large, and is graduated for setting, friction pulleys are ground to run perfectly true.

These lathes, owing to their large cone while the countershaft is equipped with two friction clutch pulleys of the latest design. The pulleys are fitted with self-oiling bushings, and the hanger boxes are ring oiling. The cone pulley and pulleys and wide bearings, are capable of taking extremely heavy cuts at coarse feed, and are guaranteed to reduce fifty-point carbon steel 1¾ inches at 1/16 feed. The swing-over bed is 16 in., and over-carriage 11¼ in. The lathe turns between centres on a 6-ft. bed, 36 inches, and will cut threads 3 to 46. The net weight is 1,700 pounds.

Baldwin Loco. Works Output.—The Baldwin Locomotive Works, after eighty-two years of continuous operation, has produced 40,000 locomotives. The first was completed in 1832, when the industry was in its infancy. The five-thousandth locomotive was built in 1850, eighteen years later, during which period two important types of good engines, the Mogul and Consolidation, were introduced and widely adopted. From 1889 to 1902, when locomotive No. 20,000 was built, compound locomotives came into extensive use, and trailing wheels, allowing increased boiler capacity without imposing excessive loads on the driving wheels, were introduced. The average annual production for the five years from 1902 to 1907 was approximately 2,000, and locomotive No. 30,000 was built in 1907. During this period occurred the introduction of the Mallet articulated compound locomotive, and the adoption of the Walschaerts valve motion. The last period is marked by the extensive use of superheaters, brick arches, and other devices, and the mechanical stoker is another accessory developed during the past few years.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

James Carruthers, President Canadian Steamship Lines, has gone to Bermuda.

J. B. Learmont, of Caverhill, Learmont & Co., Montreal, died on March 12, aged 70.

William McMaster, director of the Bank of Montreal, has arrived in London from Egypt.

J. W. Norcross, managing director of Canada Steamship Lines, leaves shortly on a tour of the lake terminals.

W. A. Black, president of the Ogilvie Milling Co., Montreal, is in Fort William. He is on a tour of inspection.

James Moore, superintendent of the Toronto Furnace & Crematory Co., died suddenly on March 14, aged 68.

Colonel Windle Pilkington, head of the famous St. Helen's glass firm, with branch factory at Thorold, Ont., died at Cannes, aged 74.

Frank Knowles, of the Goldie & McCulloch Co., Galt, has accepted a position with the D. McKenzie Machinery Co., of Guelph, Ont.

Joseph Oliver, former Mayor of Toronto, was elected President of the Canadian National Exhibition at the inaugural meeting of the Board of Directors.

Ward Curlee has been appointed city engineer of Swift Current, Sask., to succeed Geo. D. Mackie, who resigned recently. Mr. Curlee has been assistant city engineer for some time.

J. H. Larmoth, general manager of the Electric Power Co., Ltd., of Toronto, has been selected as the new superintendent of the Edmonton street railway, to succeed W. T. Woodrofe, resigned.

Sir Robert Perks, who has many Canadian financial interests, and warmly advocates the Georgian Bay Canal scheme, left London, Eng., with his son, Malcolm Perks, for Ottawa, on March 12.

Dryden, who has been manager of the Elmira Machinery & Transmission Co. for the past six months has resigned and will return to Galt. Harry Vice, son of A. D. Vice, former manager, will succeed him.

William G. Wright died in Toronto on March 10 after a long illness. Mr. Wright was born in 1847, and had been for 20 years in the employ of Bennet & Wright, Ltd., of which firm his brother is president.

Elzear Auger, a well-known shipbuilder and designer, 75 years of age, died on March 11 in Quebec. He was for a number of years dock superintendent to the Harbor Commission. He was also an expert yacht builder, and constructed a number of fast sailing yachts.

Stuart Wood, junior member of the firm of R. D. Wood & Co., manufacturers of cast-iron pipe and machinery specialties, died March 9 of heart disease at the home of his brother, Walter, in Philadelphia, Pa. He was born in that city in 1853, was educated at Haverford College and Harvard University, and later took a special course in philosophy at a college in Germany. At the age of 24 he entered the employ of R. D. Wood & Co., which was founded by his father.

WHO'S WHO.

WILLIAM NEWMAN,
Manager, Polson Iron Works, Toronto.

Toronto Branch, C.S.C.E.—About one hundred members and others attended the weekly luncheon of the Toronto Branch of the Canadian Society of Civil Engineers, when George G. Powell, Deputy Engineer of the city, gave a short address on "The Municipal Engineer." Mr. Lumsden of the Transcontinental Railway, and Mr. Hartsbury, Divisional Engineer of the C.P.R., were the guests of the society. Professor Gillespie, of Varsity, occupied the chair. Mr. Powell said that the municipal engineer's responsibilities were great, and he had to do a great deal for which he got no credit. His relation to the municipality was the same as a consulting engineer to a client. The difficulties met with in the municipal service were not always engineering ones, but rather obstacles such as the Local Improvement Act, money, and legal difficulties. The field of municipal engineering gave greater opportunity to a man than any other engineering field, owing to the diversity of the work. In the future, the sewer expert would be diligently sought after by municipal corporations, owing to the growing immensity of the problems in that line.

ATLANTIC VOYAGERS TAKE NOTE.

"She is the best and steadiest ship in a seaway I have ever been in. We have had very trying and heavy weather on both the outward and homeward passages, and she behaved splendidly. I can imagine nothing better afloat. You cannot say anything too good of the ship." Thus spoke Capt. Outram, the commander of the new Allan liner Alsatian, on the vessel's arrival at the landing-stage on completion of her first round trip.

On account of the heavy weather and fog experienced, no record runs were attempted, nor indeed would record breaking have been sought, as ships on the first voyage are judiciously "held back" somewhat. The Alsatian was slowed down a good deal owing to the above reasons, and her passage was naturally prolonged well over the time she would have normally taken in making the run across.

On the ship's arrival at Halifax, according to Mr. Green, the ship's purser, everybody in the "Liverpool of Canada" seemed to have turned out to witness her arrival, although she docked very early in the morning. During her stay at Halifax she was thrown open for inspection, and over a thousand people a day admired her splendid appointments, while the senior officers of the ship were invited to enjoy the full privileges of the Halifax and other well-known clubs, and treated generally as guests of the town. Capt. Outram was also the recipient of an illuminated address from the townspeople of his native place, Sydney, C.B., the address, it is interesting to note, being presented by Capt. James Townsend, who commanded, many years ago, one of the old Allan sailing vessels.

Industrial and Construction News 297-300

OUR CIRCULATION DEPARTMENT.

ATTENTION is drawn to the fact that the circulation department of this journal is in charge of Mr. J. I. Coddington, Ph.B., to whom all correspondence relating to non-receipt of any issue by subscribers, advertisers, etc., should be promptly sent. By so doing, the editorial department will not only be relieved considerably, but a more immediate rectifying of the trouble will be brought about.

EDITORIAL COMPLAINTS AND CRITICISMS.

OCCASIONALLY we are recipients of a complaint or criticism relative to editorial matter published, but for the most part these reach us in a more or less roundabout, indirect, and therefore, unsatisfactory manner; to wit, they rarely come direct. Let us say at once that we are not only at your service in the most direct manner possible to receive complaint and criticism, but lay claim as well to an average mortal's courtesy. Further, it is a common, every-day experience outside of the editorial feature of technical journalism, to find that an indirect approach contributes either to a distortion of facts or to an increase of fiction, or both; a set of circumstances not originally intended.

Bless you, no, we are neither infallible nor stubborn, nor are we in any sense unapproachable and inclined to aloofness. Let us get closer together then by eliminating the middleman, and you, Canadian Machinery and we ourselves will be all the better for it.

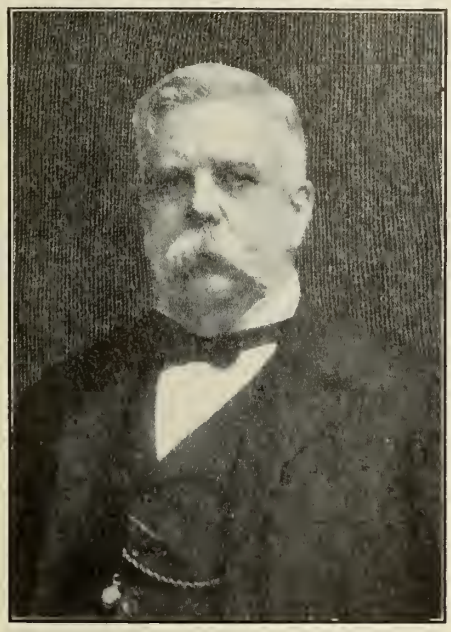
MATERIAL SUCCESS AND BENEFACTION.

HAS it ever occurred to you that the record of material success in the majority of cases spells only dismal failure for the individual concerned, in that his achievement was toward one direction, to wit, the selfish. There is everywhere in evidence a sharply defined distinction drawn between so-called successful men and he whom we term a benefactor of the race, and the distinction exists even although the former by the distribution of accumulated wealth,—the mark of success, seek enthronement later as a benefactor. We never associate with Edison or Westinghouse the statement that they have been successful inventors or successful business men; rather, do we in all cases speak of them as world benefactors, and speaking of these men whose work has been along a rugged pathway in which success and failure each filled an equally important place, we in the very nature of things overlook even if we happen to know of their failures, because we believe that personal success was not the paramount aim.

The toilers in our workshops and factories, in our offices, on our ships, on our farms, etc., although lacking the genius of Edison and Westinghouse, have the same conditions to meet, the same intermingling of success and failure, and who knows but a multitude of these in every age, by failing to achieve apparent material success have otherwise like these had bred in them something of more intrinsic personal worth and have accomplished an ideal, that entitles them to be reckoned as world benefactors instead

The passing of George Westinghouse marks the climax of a busy life, a strenuous fight against, in many cases, long odds. He gave to the world and humanity of his best, and even though his material wealth at his decease may run to millions, he gave more than he got in that respect. Inventive genius such as his was unlimited in its scope, and little wonder was it that on many occasions he was well nigh "broke." It has been said of him that capital could not keep pace with his genius. Accumulation of wealth and genius don't usually associate in us mortals, and it is perhaps just as well.

Courage consists not in blindly overlooking danger, but in meeting it with the eyes open.—Richter.



INDUSTRIAL NOTABILITIES--No. 26

GEORGE WESTINGHOUSE is dead. He was born at Central Bridge, N.Y., 68 years ago. His father was a machinist, and he spent much time in the shop, and at 15 he had invented a rotary engine. As a youth, he served in the Union army and navy in the civil war.

In 1865, he invented a device for replacing derailed steam cars, and in 1868 he, as a result of a railway wreck he had witnessed, produced the famous air brake, which is claimed to have saved more lives than Napoleon lost in all his battles.

He had to fight hard to get it even tried on a railroad, for when old Commodore Vanderbilt was applied to and heard that the applicant proposed to stop railway trains with wind, he said curtly that he had no time to waste on fools. Westinghouse was then just out of his 'teens.

The first train stopped by the brake stopped so quickly that it was wrecked in the process. As the story goes, Westinghouse climbed upon the engine cab just before the start, grasped the engineer by the hand, and whispered to him: "All I ask is a fair show," and jumped off.

GEORGE WESTINGHOUSE.

He got his fair show, but many more weeks of hard work were found necessary to perfect the invention so that the brake would act simultaneously upon all the cars of a train.

The generation of power at Niagara and electrical development generally is largely associated with the work and enterprise of Westinghouse.

He was literally a horny-handed son of toil, for his hands were hardened and seared from much contact with tools and metal. Those who knew him best called him "the man who worked." He had to meet financial difficulties more than once after becoming famous as an inventor and manufacturer, but overcame them, and a few years ago his personal fortune was estimated at $50,000,000. His wife, whom he married in 1867, and one son, George Westinghouse, Jun., survive him.

Paule Latzzke in an article in Everybody's said of him:

"Simple as a child with his friends, cheerful, plain, unaffected, democratic to the last degree, yet strong as a lion. A man of huge proportions and the strength of an ox, standing six feet in his stockings, yet so gentle in disposition that no one has ever seen him angry; simply 'impatient.' He never asks anyone to do a thing he would not do himself. He is a tremendous fighter, but always fights fair. He is generous to a fault."

SELECTED MARKET QUOTATIONS

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

THE BUSINESS OUTLOOK.

USUALLY the middle of March sees more activity in business, but the seasonal movement, generally speaking, is much lighter than a year ago. Orders and inquiries are neither as large in volume nor as pressing as is usual when the winter shows signs of breaking. In Ontario and Quebec business is far from normal, and this condition will obtain until the industrial situation clears up.

Industrial balance sheets are disclosing a state of affairs no better than anticipated, and one manufacturing house, the balance sheet of which will not be issued for three months, has been commendably frank in stating that business will be much below the previous year's standard both as to profitableness and as to volume.

If reports as to the decision of the Government to guarantee bonds of the C.N.R. are true, they will be a factor in clearing up the business outlook. Just as soon as the Government's decision is made law, the Canadian Northern will be compelled to place orders for at least $8,000,000 of new rolling stock. This will go to Canadian firms. There still remains, however, the unsatisfactory position of the National Transcontinental Railroad. It is as necessary to get this line into commission as to complete the Canadian Northern System.

Montreal, Que., March 16, 1914.—Will the Federal Government at Ottawa listen to the request of Mackenzie and Mann for assistance in completing the Canadian Northern Transcontinental Railway? This is a question in which the public is taking a lively interest just now. Opinion in Montreal seems to be sharply divided on the subject, most people being of opinion that the C.N.R. has perhaps already had as much public aid as it deserves. There is no doubt, however, that should the Government agree to guarantee the C.N.R. bonds the business outlook will be considerably cleared up. Just as soon as a favorable decision is reached, the Canadian Northern will have to place orders for much new rolling stock, a large proportion of which would doubtless be built in Montreal.

In future the Marine Department at Ottawa plans to advance the opening of navigation on the St. Lawrence very materially, and with this end in view has just let the contract for a large ice-breaker, 275 ft. long, 56½ ft. wide and 32 ft. deep. Her engines will develop 8,000 I.H.P. and she will, it is said, be the largest and most powerful craft of her kind in the world. The Canadian Vickers Company is said to have secured this important contract and the vessel will be constructed at their Montreal yards. The contract price is understood to be nearly a million dollars.

The Marine Department plan to put the ice-breaker at work at the Cap Rouge ice bridge each winter, to prevent the undue accumulation of ice, and the vessel will afterwards work between there and Montreal in conjunction with the Montcalm and the Lady Grey. Not only will the opening of navigation be greatly advanced, but the spring floods along the St. Lawrence will be much reduced or altogether obviated.

Metal Markets.

The pig iron movement that made itself felt a few weeks ago has died down. Buying was at all times cautious, and the recent slight advance in prices has apparently resulted in killing what little life there was in the market.

There has been a slight drop in the price of electrolytic copper and pig-lead is a trifle easier; but otherwise, prices remain unchanged. The old metal market is extremely quiet.

Toronto, Ont., March 17, 1914.—As far as can be ascertained there appears to be a general impression that the tide is turning, and that better conditions may be anticipated in the near future. It cannot be said that there is as yet any pronounced improvement to be recorded, but indications point to an increased volume of business with better prices, although the recovery may be slow in materializing. The improvement anticipated will depend to a great extent upon the condition of the money market, which at present is weak.

One favorable feature in the steel market is that prices are showing a decided tendency to stiffen, and we are informed from a reliable authority that the producers who supply a large part of the steel for Canadian consumption are determined not to sell below cost. This indicates that there will be an upward tendency when the demand increases, which should take place soon, for, with better weather conditions, there will be increased activity in the building trade. The number of inquiries for structural shapes is gradually increasing, and in this respect we might say that the improvement was normal, although no large orders are being booked and prices have not changed.

Pig iron is still weak, the demand being light and few sales recorded. Stocks are getting low, and will need replenishing; it is, therefore, reasonable to suppose that the iron market should become stronger at no distant date.

The demand for tool steel and machine shop supplies continues fair, with improving prospects.

The improvement noted last week in the machine tool business has been maintained, the outlook if anything having improved. Inquiries are more general, although specifications are light. An inquiry has been sent out by the C.P.R. for a number of new tools for the steel car shops at Montreal, the list being given in our industrial columns. This is the only specification of importance that has been received here during the week. A local firm of dealers report having sold a number of machine tools to the Patent Selling Co. and the Children's Hospital, both in this city. In the former case all the tools were equipped with motor drives. Another firm report having sold a Brown & Sharpe milling machine to a local concern.

No change can be reported in the metal market this week, the general condition being quiet, with prices firm and orders to small specifications only.

Ottawa, March 17, 1914.—Speculation is still rife here as to the outcome of the two big questions of the day, in which the business and financial world are particularly interested—tariff changes and aid to the Canadian Northern. It will be a week or more yet before there is anything official on either of these questions.

During the past week two efforts were made to draw the Government on its attitude on tariff changes. Mr. J. J. Carrick, member for Thunder Bay and Rainy River, asked assistance for the iron and steel industry, pointing out that it was now in a very depressed and languishing condition. The policy he advocated was a bounty of $1 a ton on all iron ore mined in Canada. W. E. Knowles moved a resolution asking that agricultural implements be put on the free list. In both cases the members were informed by the Government that there would be no announcement until the budget was brought down, and that in the meantime the matter would be given the most serious consideration.

The Government is keeping its own counsel, and absolutely nothing will be definitely known until Mr. White rises on Thursday afternoon, March 26 and introduces the budget. Your correspondent, however, is informed on very good authority, though, that both requests will be at least partially granted. It is believed that the steel industry will be given some assistance, though not in the form of bounty. The assistance will be increased duties on certain items, such as wire rods, etc. On the other hand there will be a substantial cut in the duty on agricultural implements from the present duty of 17 per cent. to 10 per cent. This is the present plan and there is every reason to believe that it will be the announcement which Mr. White will make. As to just how far the assistance to the steel industry will go no one knows.

As for the C.N.R. question, it is still more or less in status quo. The C.N.R. have made formal application to the Government for a bond guarantee. The application was accompanied by an elaborate memorandum expressing the reasons why the C.N.R. believed they were entitled to aid. The amount has not been named. This is left to negotiations. A sub-committee of the Cabinet has had the matter under consideration

---

St. John, N.B., March 14, 1914. — While business continues quite prosperous and encouraging with Maritime Province industrial houses, there does not seem noticeable the same stir of activity which has characterized other seasons at this time of year. Orders with most houses are being received well up to standard, but talk of new buildings or additions, enlargements, etc., is not so commonly heard as at other times. However, most managers of the large industrial houses are looking forward to a successful year.

So far as St. John is concerned, business keeps well up to the average, and there is still talk of new industrial establishments. Whether or not they will materialize cannot, of course, be definitely said as yet, although it is fully believed that after the snow has cleared from the ground there will be a movement in this direction. The different buildings now in the course of erection are well advanced. The E. G. M. Cape Company has started the preliminary work preparatory to actual construction of the new wharves at Sand Point, west side. One of these wharves is to be 850 feet long, the other 600 feet.

A new factory is to be built at Moncton by the J. A. Marven Co., who will vacate their present premises and erect a plant immediately east of the Havelock Mineral Springs building. The structure will be fireproof, of concrete and brick, and will be about sixty feet by one hundred and forty. It will probably be a four-storey building.

A fifty-ton sulphite pulp mill is to be erected at Bathurst, N.B., by the Bathurst Lumber Co. Work is to be started immediately, and early next year it will be possible to purchase for the first time a domestic product of the highest grade cook-bleached mitsherlich sulphite paper. The mills will be operated under the name of the Bathurst Pulp and Paper Co., Ltd., with a capitalization of $3,000,000. Angus McLean, general manager of the Bathurst Lumber Co., will be president, and A. G. McIntyre, editor of the Pulp and Paper Magazine, and a former St. John boy, will be manager. The company owns 2,800 square miles of limits extending from the plant itself.

Negotiations which have been pending for the purchase of the Yarmouth (N.S) Light and Power Co. have terminated in the acquisition of that concern's plant and interests by the New England Light & Security Co

---

Algoma Steel Corporation.—The Canadian Agency circular says that contracts have been let for the completion of the existing battery of open-hearth furnaces of the Algoma Steel Corporation. This will involve the addition of two new furnaces and a mixer, bringing the capacity of this particular plant from 15,000 to 20,000 tons of ingots a month.

UNION CARBIDE CO. PLANT, WELLAND, ONT.

REPRESENTATIVE of an investment of over a million of dollars, the Welland plant of the Union Carbide Co. is now nearing completion. The expedition with which the construction of this plant has been carried out by the Lackawanna Bridge Co. is worthy of comment. Ground was broken on October 1st, 1913, and at the present time some of the machinery has been installed, while practically all of the buildings are ready for the official opening on April 1, 1914.

Some idea as to the extent of this new plant can be obtained from the following facts: Site—forty acres; Railroad sidings—two miles; Factory buildings—eight; Employees—Three to five hundred; Annual wage roll—Approximately three hundred thousand dollars; Private systems—Water, sewerage, filtration.

Buildings.

The various buildings are as follows: The lime kiln building, 360 by 66 feet, is of one storey and of steel construction, with corrugated iron roof and walls; the furnace building, two storeys, 280 feet by 76 feet; the mixer building, two storeys, 66 by 28 feet; the storage building, one storey, 180 by 60 feet; The machine shop, office and drum factory building, two stories, 260 by 60 feet, of steel and brick with cement tile roof. The three-storey packing building, 140 by 76 feet, the one-storey cooling building, 180 by 68 feet, and the two-storey terminal building, 120 by 45 feet, are of similar construction.

The Product.

The product of the Company is calcium carbide, and the procedure of raw material from the railroad cars to the finished article is modern in every respect. The railroad cars with raw material enter the lime kiln building over an 800-foot trestle, and are dumped into their various bins. From these the material is sent over to the furnace building by belt conveyor. After passing through electric furnaces it is conveyed to the cooling building by electric cars, thence to the packing building where the product is crushed, and placed in drums and forwarded to the storage building ready for shipment. The drums for shipping finished product are manufactured in the drum factory building on the ground floor. The drum storage is on the second floor, where surplus empties are stored, these being conveyed as required over to the packing building with trucks via a steel bridge. All the buildings are connected with closed steel bridges.

John White is general superintendent of the plant with R. C. Thompson as works superintendent.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Lachine, Que.—The town may build and equip a new pumping station this year.

Toronto, Ont.—The Canada Foundry Co. pipe shop has shut down for an indefinite period. No reason was given for doing so.

Hamilton, Ont. — A new company known as the Hamilton Specialty Mfg. Co., Ltd., will establish a plant here for making lock nuts and other specialties.

St. John, N.B.—T. McAvity and Sons, Ltd., are planning an immediate outlay of $300,000 upon their new plant, including brass and iron foundries.

Montreal, Que. — The Hawley Down Draft Furnace Co., Easton, Pa., is installing three of its down draft smokeless furnaces in the Peace Centennial School here.

Newcastle, N.B.—A company is being formed to manufacture a new weighing scale patented by Mr. E. G. Hedman of Rosebank. The new factory will probably be built here.

Toronto, Ont.—A building permit has been issued by the city architect to the Canada Metal Co. for the erection of a one-storey brick addition to their factory on Fraser Avenue, near King Street, costing $7,000.

Quebec, Que.—The Canadian Northern Railway is about to erect a large coal-discharging plant at this port, as well as extending its coal wharf 150 feet, making it sufficiently large to hold 12,000 tons of coal.

Redcliff, Alta.—Mr. Corson, manager of the Ornamental Iron Co., states that they expect to close a contract in a few days for a very large order of ornamental iron, and that it will mean an increase of their working force.

Steelton, Ont.—The Algoma Steel Corporation will build open-face furnaces. Tenders for building and equipment will be in by May 1. Gas engines, motors, air compressors, blowers, boilers, cranes, etc., will be required.

Ottawa, Ont.—It is considered probable that the Beach Foundry Co., of Iroquois, Ont., will move their plant here. It is reported that the company have amalgamated with the Butterworth Foundry and that the operations of both concerns will be extended.

Woodstock, Ont. — The Woodstock Water and Light Commissioners are considering the question of installing water meters in all larger residences, stores and public buildings. It is estimated that a considerable saving can be effected by this means.

Fort William, Ont.—W. H. Osborne, president of the Wisconsin Malleable Iron Company, has been in conference in Chicago with John Crerar, of Crerar, Clinch & Co., on the subject of a branch plant at Fort William, Ont. Mr. Osborne has been looking into freight charges on raw material to Fort William.

MACHINE TOOL REQUIREMENTS.

The C.P.R. are in the market for the following equipment for their new steel car shops, Montreal:

Plate Straightening Rolls.
Power Cornice Brake.
High Speed Sensitive Drill.
Circular Shears.
Plate Squaring Shears.
Plate Bending Rolls.

Waterford, Ont.—A factory in Waterford has been purchased by the Universal Chemical Electric Co., which is composed principally of Brantford capitalists, with Albert J. Jacobs as general manager. The company will manufacture telephones and supplies, electric fixtures, magnetos, dry-cells, electrical sundries, etc.

Penticton, B.C. — Councillor Mutch gave notice that at the next meeting of the council he would introduce a by-law for the installation of another Deisel oil engine and an additional generator at the power house. Boving & Co., of Vancouver, have written, stating that they would guarantee to install a 200-h.p. Deisel oil engine by the beginning of November.

Winnipeg, Man.—It is likely that a new contract will be entered into with the American Well Works Co., of Aurora, Ill., for the purchase of three new pumps. The contract, if awarded, will probably be on the terms that the contractors must take the responsibility of the pumps working satisfactorily. The pump now being tested is in well 25, and is pumping over 800,000 gallons per day.

Pembroke, Ont.— The town council are negotiating with the Electrical Mfg. Co., of Canada, who desire to build a factory here. The company will erect buildings and machinery to the value of $200,000. A fixed valuation for municipal taxes at $25,000 for ten years has been granted, and in return, the company guarantee that $200,000 worth of stock shall be taken up in cash before they start operations.

Swift Current, Sask.—The new power plant, which has been erected on a portion of the industrial site recently purchased by the city, was put in operation on March 10. A 200-watt unit is being used to develop power for the present, but a 400-watt unit will be installed this summer. The main business thoroughfares of the city were lighted by the new five-cluster lights set on ornamental iron standards.

Winnipeg, Man. — A plant has been built and equipped by the O-Rib-O Mfg. Co., at 233 Spadina ave., for the manufacture of sheet metal products, including stove piping, and stove pipe elbows, garages, refrigerators, and hot air furnace requirements. The plant at present measures 48 x 70, and will be increased to 50 x 150 shortly. John Brockest, of Clare & Brockest, May street, Winnipeg, is president.

Medicine Hat, Alta.—Plans for the new radiator plant to be built south of the city's industrial site by E. L. Carey Wright, are being prepared by H. A. E. Brown, architect. The plant will occupy a building 288 feet by 80 feet, including the foundry, machine shop, warehouse and core room, and there will also be a store house 20 feet by 95 feet, and a small office building separated from the main building.

Alliston, Ont.—The town of Alliston voted on a by-law on March 12, in favor of the Dominion Gas Tractor Co., to give it a free site, a fixed assessment of $2,000, and free water for ten years. The by-law carried by a vote of 243 for and 4 against. It is understood the Dominion Gas Tractor Co. will proceed to erect a building at once, and will manufacture gas traction engines for use principally on farms in the West.

Edmonton, Alta.—Representatives of the firm of Smith, Kerry & Chase, Ltd., of Toronto, are making an inspection of water power in Athabasca River at Grand Rapids, Alta., with a view to erecting a plant, estimated to cost from $5,000,000 to $10,000,000. The lease of the site is held by H. W. Adcock of Winnipeg. J. S. Kerry, a member of the Toronto firm, says that it will be possible to transmit power from the Rapids to Edmonton, 175 miles distant.

Victoria, B.C.—Further additions to the Jordan River plant of the Vancouver Island Power Co., will be commenced within a short time to provide for the third unit. This will bring the aggregate capacity of the plant to 25,000 horse power and complete the installation of the 13,000 horse power increase authorized to the original plant of 12,000 horse power. The machinery is already on the ground and as soon as the building, to cost about $75,000, is complete, the plant can be installed.

Electrical

London, Ont.—Excavation work for the addition to the Horton Street hydro plant will be commenced at once. The plans have been completed, and the building will be constructed by day labor.

Islington, Ont.—Etobicoke Township Council and Weston Hydro-Electric Commission held a conference on March 9, in the council chamber at Islington. Negotiations were made for several electric extensions in the township.

Kelowna, B.C.—The Belgo-Canadian Fruitlands Co., have submitted a proposition to the council to supply the town with light and power from a hydro-electric plant, which they would install on their property at Mission Creek.

Petrolea, Ont. — Hydro radial meetings under the direction of Mayor Stirrett, representative of the county council for hydro matters, have been arranged as follows: Brigden, March 12; Courtwright, March 16; Sarnia, March 19.

Galt, Ont. — The report of the Galt waterworks superintendent shows an increase of over a million gallons pumped in February as compared with the same month last year, but a decrease in the cost of $32, owing to the employment of hydro-electric power.

Toronto, Ont.—The Toronto Electric Light Co. propose constructing underground conduits and placing wires therein on the following streets: Intersection of King and Yonge; Victoria street, opposite Loew's theatre, and south-west corner of Jordan and Melinda streets.

Owen Sound, Ont.—At a special meeting of the town council and the Board of Trade, called last Thursday, a local branch of the Ontario Hydro-Electric Union was organized. The project has been fathered by the secretary of the provincial association.

Toronto, Ont.—The townships wanting the Toronto, Markham & Port Perry electric radial from the Provincial Hydro can have it as soon as they vote in favor of the scheme. All the details are ready and the surveys and bills of material in order.

Kincardine, Ont. — A proposition is under consideration to do away with the present arc lights and substitute incandescent lights. Engineer Ingram's estimate of the cost of installation is $2,500. The matter was left over for further consideration by the council and commissioners.

St. Mary's, Ont.—The Water, Light and Heat Board, has received from the Hydro-Electric Commission its recommendation concerning the proposed changes in the street lighting system. Engineer Caster recommends that the present arc lights be replaced by 80 c.p. tungsten lamps. The cost of the change is estimated at $10,000.

Guelph, Ont.—At a meeting of the city council on March 16 a resolution was adopted asking the Hydro-Electric Power Commission to investigate and report on a proposition to construct hydro radial lines from Guelph to Hillsburg and Erin and through the Townships of Eramosa and Erin to Orangeville. A request will be made for a statement of costs, probable revenue, etc.

St. Mary's, Ont.—Mr. Mooney, Stratford, is arranging for a hydro-radial meeting at Stratford, this week, to further the interests of hydro-radial lines in western Ontario. Delegates are expected to be present from Goderich, Clinton, Seaforth, Dublin, Mitchell, Fullarton, Monkton, Atwood, Listowel, Millbank, Milverton, New Hamburg, Baden, Wellesley, New Dundee, Plattsville, Tavistock, St. Mary's Exeter, Hensall and other places.

Municipal

Sherbrooke, Que.—The town of Bedford will build several miles of new roads this year and will require road machinery.

Barrie, Ont.—At the meeting of the Board of Works of the town council held on Wednesday, March 4th, the matter of the purchase of a horse-sweeper was taken into consideration.

Calgary, Alta.—The Council will recommend expenditure of $300,000 on extensions to the electrical plant.

Medicine Hat, Alta.—The city council is spending $65,000 on machinery and equipment for a municipal power station.

Welland, Ont. — Welland County Council on March 11, decided to build 34 miles of the county good roads system by contract this year, in addition to the twenty miles it is estimated will be built by the three county outfits.

Chatham, Ont.—According to information received in the city from the Hydro-Electric Commission, the Chatham Gas Co. has withdrawn its offer of $410,000 for the sale of their plant to the city.

Port Arthur, Ont.—The request from the Board of Trade for a grant of $3,500 to carry on the publicity work of the city was again turned back to the finance committee at a meeting of the council recently.

Berlin, Ont.—The Industrial Committee, consisting of members of the city council and Board of Trade, have asked the city council to make a grant of $1,000 toward establishing an industrial Bureau, on condition that the citizens contribute $1,200 annually for a period of three years.

London, Ont. — The members of the Board of Health are of opinion that the only solution of the meat problem is the establishment of a municipal abattoir. The action of the board in putting only $2,000 in its estimates for meat and milk inspection does not indicate that the proposal for a civic abattoir has been abandoned.

Ottawa, Ont. — City Engineer Currie has explained, in answer to questions put to him by Ald. Fisher, that a mechanical filtration plant such as he reported upon for Mayor McVeity would cost $1,400,000 if the supply were to be only twelve million gallons a day. The annual cost of operation and the fixed charges of this would amount to $160,000 a year.

Hamilton, Ont.—The officials of the works department are busily engaged in preparing plans for the sewage pumping station it is proposed to build north of the Jockey club, and also on plans for the extension and improvement of the Trolley street disposal plant, so that it will be capable of handling all the sewage of the east end and in a more up-to-date manner than at present. The total cost of these works will be about $110,000. The council has yet to authorize the work to be started.

Regina, Sask.—Seven money by-laws involving a total expenditure of $1,441,000, will be submitted to the burgesses on March 18, for the following: Storm sewers, $170,000; waterworks extensions, $360,000; light and power generation, $244,000; hospital extensions, $175,000; street railway extensions, $250,000, light and power distribution, $160,000; sewage disposal works extension, $82,000.

Prince Rupert, B.C.—Steps are being taken to conduct a big publicity campaign in view of the opening of the Panama Canal next year. It is the intention to rush buildings under construction to completion by that time, representing an aggregate of approximately six million dollars. It is expected that an effort will be made to have the city and its resources represented at the fair.

Kingston, Ont.—J. V. Lyon, Guelph, secretary of the executive committee of the Great Waterways Union of Canada, and Controller T. L. Church, Toronto, will go to Kingston to address a meeting of the city council and board of trade in connection with development of hydro-electric power and radials in eastern Ontario and the deepening of the St. Lawrence and Welland Canals.

Nelson, B.C.—Voting on the municipal by-law on March 4, to decide if the City of Kaslo would purchase the lighting plant of the Kootenay Electric Co., resulted in the voters of Kaslo indorsing the purchase. Only eleven votes were recorded against the purchase. The price to be paid is $27,500, the purchaser to take fifteen thousand dollars in twenty-year bonds at six per cent.

Port Arthur, Ont. — The Provincial Board of Health has promised that pressure would be brought to bear on Fort William to establish a sewage disposal plant as soon as that city made application for additional sewer outlets. This would prevent raw sewage being dumped into the bay from Fort William, when Port Arthur was compelled to treat their sewage.

Sault Ste. Marie, Ont.—At a meeting of the town council on March 9, the matter of having a clause inserted in the private bill now before the Legislature to enable the city to extend the time for the commencement of building operations on the dry dock was referred to the By-laws and Legislation Committee, which will probably report to a special meeting of the council later.

Toronto, Ont. — Mayor Hocken told the Board of Control that he had instructed General Manager Couzens of the Civic Hydro Commission to investigate the value of the Interurban Electric Co. plant, franchise and business within the city limits. The purchase was suggested by the Provincial Hydro-Electric Commission. The board decided to await the report of Mr. Couzens before taking further action.

Windsor, Ont.—The council has decided to purchase an incinerator from the Toronto Furnace & Crematory Co., at a cost of $23,700; the incinerator to have a capacity of 25 tons per 24 hours. Other firms tendered as follows: Canadian Griscom-Russell Co., Montreal, $18,400; the Decaire Co., Minneapolis, $25,000; Heenan & Froude, through their Montreal representatives, quoted $40,000 for a 50-ton plant.

Winnipeg, Man.—A scheme is being considered for supplying Brandon, Portage la Prairie, Carberry and Virden with current from Point du Bois. It is estimated that the cost of constructing transmission lines, sub-stations, etc., would be about $1,000,000, and that unless 20,000 h.p. could be disposed of, the proposition would not pay. A committee has been appointed to investigate.

Sault Ste. Marie, Ont. — The town council are considering the purchase of an incinerator. The Sanitary Committee reported that after considering both incinerator and reduction plants for the disposal of garbage, they recommended that a contract be given to the A. H. Reid Incinerator Co., to construct a plant to cost $14,000, to be erected on the city's Spring street water lot. The incinerator would have a capacity of 15 tons in 24 hours.

Kingston, Ont. — An offer for cheap power has been made to the city by Boyd Caldwell, Lanark, who presented his proposal to Mayor Shaw and T. J. Rigney, chairman of the civic utilities commission. The proposal is to sell the falls on Madawaska River at Calabogie for the generating of electric power. Caldwell claims that from his property can be generated a minimum of 6,000 h.p. for continuous service. The falls are ninety miles from this city. The matter will be taken up by the civic utilities commission.

Toronto, Ont.—Works Commissioner Harris has had plans prepared for the proposed widening of Main Street between Gerrard Street and Danforth Avenue. One plan, providing for a 5 per cent. grade in the approaches to a subway under the Grand Trunk tracks, in place of the existing bridge over the tracks, will cost, exclusive of land damages, about $207,750. Another plan, with a grade of about 3¼ per cent., will cost $288,500. Mr. Harris favors the former scheme, and expresses the view that the cost of the improvement should be borne by the city at large.

Building Notes

Belleville, Ont.—At Belleville construction work to the value of $5,300 has been undertaken during the past month.

Lethbridge, Alta.—Lethbridge building returns for last month total $10,200, or slightly less than the February figures last year.

Montreal, Que.—A new $100,000 school will be erected by the Catholic School Commissioners at the corner of Fairmount and Bloomfield streets, for which Mr. Jos. Godin is the architect.

Montreal, Que.—E. & W. S. Maxwell are architects for the new Marcil Trust building, to be erected on the site of the old Herald building, the plans for which have not yet been announced.

Fort William, Ont.—It was decided at a meeting, held on March 9, of labor men of the city, to commence the erection of a Labor Temple in the near future. The new building will cost $25,000.

Montreal, Que.—C. A. Reeves is architect for a new police and fire station to cost $96,000 to be erected in Bordeaux Ward, while other stations will probably be built in St. Ann's, Notre Dame de Grace, and Longue Pointe wards.

Quebec, Que.—A slight drop in the value of building permits for February is reported from Quebec City; but for the two months of this year the figures compare favorably with last year, being $97,850 as against $50,300.

Halifax, N.S.—Halifax has been showing signs of structural development, the building figures for February being $14,380, as against $6,500 for the same month of last year. This brings the total for the present year to $25,590.

Montreal, Que.—Telephone exchanges are already under erection in Outremont and Point St. Charles, and another is expected shortly to be built between Clark and St. Urbain streets on Ontario street.

Toronto, Ont.—The City Architect's Department have issued a permit to Soren Bros. for the erection of a four-storey brick factory on King street west, near Spadina avenue. The new structure will cost $42,000.

Montreal, Que.—It is stated that a hippodrome will be built here. It will be modeled after the hippodrome at New York, and provide high-class vaudeville at popular prices. The arrangements are in the hands of L. B. Totens, acting for a New York syndicate, who plan similar ventures in Toronto, Vancouver, and Winnipeg, and it is stated work will be commenced on all of them in the spring.

Trade Gossip

The Polson Ironworks, Toronto, launched a dump scow on March 11. The vessel is one of three being built for the Quebec Harbor Commission, and is 150 ft. long, 40 ft. beam, by 15 ft. deep.

Fraser & Chalmers of Canada, Ltd., 4 Phillips Place, Montreal, have been appointed Canadian agents for W. H. Allen, Son & Co., Bedford, England, builders of steam, hydraulic, and electrical machinery.

The E. J. Woodison Co., Toronto and Detroit, advise us that they have completed the installation of a buffing composition plant, and that they contemplate making all kinds of buffing composition of the highest grade, including Woodison crystal finish for nickel on brass and nickel on iron, tripoli, corcus, emery cake, coloring composition, etc. They are also placing on the market a metal rim riddle with an adjustable bottom, or refill. The riddles are being made in both 18-in. and 20-in. sizes and with both galvanized and brass bottoms or sieves.

Winnipeg, Man.—At a Council meeting on March 9 two big contracts were awarded, one of $130,000 for steel pipe to the Canadian Steel Pipe Co., and one of $51,720 for the laying of the pipe to the Hurst Engineering & Construction Co. The pipe is lock bar, and of the total amount of 24,000 feet, 4,000 feet is to replace the wood stave pipe between well 8 and well 10, while the balance is to replace the present 18-inch cast iron pipe between well 8 and the reservoir. The Hurst Engineering Co. was the lowest of four tenderers for laying the pipe, and work will be commenced at once.

Bounty on Iron Ore.—R. R. Gamey in the Legislature has given notice of a bill under which he hopes to secure the re-establishment of the bounty on iron ore mined and smelted in Ontario. Under present conditions, iron is brought in from all parts of the world to the disadvantage of Canadian industry, and it is anticipated that if the bounty were re-established of, say, $2 a ton on the pig product, it would result in the erection and creation of smelters in different parts of the province, involving an expenditure of several millions of dollars.

To Share Profits.—Manager E. G. Henderson, of the Canadian Salt Co., with plants at Windsor and Sandwich, Ont., has announced that his company will immediately start a profit-sharing plan with its employees. While not so pretentious as the plan of Henry Ford, nearly one hundred men will get 5 per cent. on the wages earned in a year. Employees who have been with the company one year are eligible to participate in the plan. There are a large number of girls employed in packing the products of the company, and these will also share in the profits.

Toronto, Ont.—The building permit for the new Methodist Book and Publishing House, to be erected on the block bounded by Queen, John and Richmond streets, has been issued by the City Architect's Department. The permit calls for the erection of a five-storey brick concrete and terra-cotta building strong enough to carry a load of another five storeys, which may be added some time in the future. The cost of the building, according to the contracts, will be about $600,000. The John H. Parker Canadian Co. are the builders, while Burke, Horwood & White, of this city, are the architects.

Anticipated Tariff Changes.—With the Budget speech coming some two weeks hence, rumors of tariff changes are beginning to be whispered in the Government ranks. There is a well-defined belief that there will be a reduction of the duty on agricultural implements to 10 per cent., the present duty being 17½ per cent. This will be the Government's attempted compromise with the farmers. It is expected that the Government will also do something for the iron and steel industry. It is not believed, however, that there will be any very drastic change in the present iron and steel schedule, but some minor changes calculated to help the industry are known to be contemplated. The whole question will probably be threshed out at a party caucus to be held before the Finance Minister makes his Budget speech. It is practically certain that free wheat and free flour will not be granted this session at least.

Investigate Canadian Iron Resources.—Following up a discussion on the present status of the iron industry in Canada, a resolution was proposed at the March 6 session of the Canadian Mining Institute by Mr. Eugene Coste, seconded by the President-elect, Mr. G. G. S. Lindsey, K.C., and carried, directing the attention of the Dominion Government to the fact that the iron industry was greatly handicapped because extensive deposits of the same high grade as were found in the United States, Newfoundland and Cuba had not yet been located in Canada, although it was believed that they existed, and that they could be found were endeavors made. The Institute, therefore, urged the Government to take such means through the proper channels either by a geological survey or by a special committee of experts, as would determine the extent and value of Canada's iron resources, a procedure which would add immensely to the economic wealth of the Dominion.

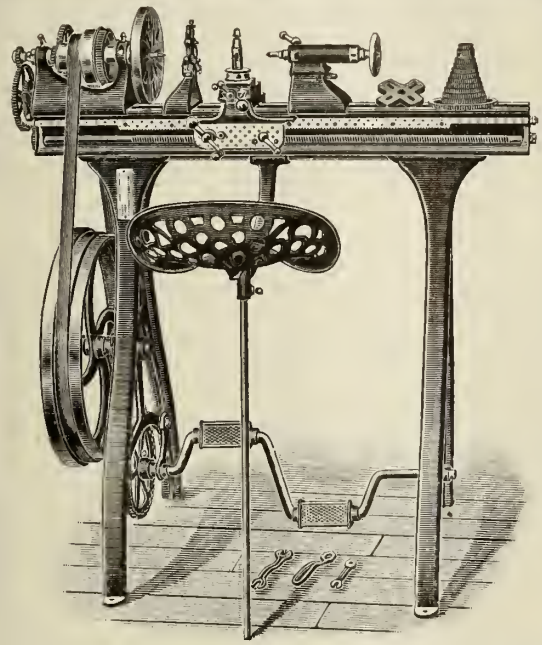
Catalogues

The Gridley automatic multiple spindle drill is dealt with full in a catalogue which we have received from the Windsor Machine Tool Co., Windsor, Vt. A general description is given of this machine, in addition to illustrations showing tools in position for various operations, and specimens of work produced by the Gridley drill.

The H. E. Barton Tool & Supply Co., Chicago, have sent us a number of leaflets dealing with the electrical tools manufactured by the Stow Manufacturing Co., Binghampton, N.Y. The leaflets cover portable electric breast drills, tool post grinders, bench grinders, etc. A specification, together with illustrated description, is given for each type.

Morris type "P" swing jib-crane is the subject treated in a bulletin recently issued by the Herbert Morris Crane and Hoist Co., Toronto. The illustrations include views showing the jib-crane in operation and different types of worm gear chain-blocks used with these jib-cranes. The last page shows a diagram of jib-crane with table giving principal dimensions for each size.

"McLain's system," Milwaukee, Wis. are distributing a pamphlet dealing with the McLain system of producing semi-steel. The pamphlet contains for the most part private correspondence between David McLain and A. J. Witt, general manager of the Cumberland Foundry and Manufacturing Co., Nashville, Tenn., regarding the introduction of the system in the latter plant.



Heating Feed Water With Exhaust Steam is the title of Catalogue No. 51, recently issued by the National Pipe Bending Co., New Haven, Conn. The catalogue deals with heating feed water and the advantages of a closed heater, followed by a description of the "National" heater, and accompanied by several exterior and interior views showing the general construction. Tables are included, giving the dimensions and weights of the various sizes.

Ronald Trist & Co., Ltd., London, Eng., have sent us a smart-looking bulletin dealing with the "Thermo-feed" Differential Pump Governor which they manufacture. A comprehensive description is given of the governor, with special reference to its principal features, together with an excellent illustration. A leaflet containing the working details is enclosed with the bulletin. The leaflet shows a sectional view of the "Thermo-feed" Governor, each part being numbered, and its method of working de-

"WILLIAMS" MACHINERY LIST

Always in Stock

Immediate Shipment

No. 4½ Barnes Lathe

Price with either foot-power or countershaft, f.o.b. Toronto

$87.00

Specifications

Swing over bed—9 ins. Swing over carriage—4½ ins. Takes between centres 25 ins. Complete with full set of screw-cutting gears. Cutting threads 5 to 50 per inch—⅜ in. hollow spindle. Large and small face plates, steady rest wrenches — Foot power or countershaft.

IF IT'S MACHINERY WRITE "WILLIAMS"

The A. R. Williams Machinery Co., Ltd., 64-66 Front St. W., Toronto

scribed very clearly. Copies may be obtained by writing.

McLain's Semi-steel is the title of a catalogue which has been issued by McLain's System, Milwaukee, Wis. The catalogue contains principally a number of testimonials from firms who have adopted the McLain System in their foundries. There are also several pages devoted to foundry practice, and the advantage of producing semi-steel castings, together with illustrations showing castings of various kinds made of this material.

Baldwin-Westinghouse Electric Mine Locomotives is the title of Catalogue No. 1525, published jointly by the Baldwin Locomotive Works, Philadelphia, Pa., and the Can.-Westinghouse Co., Ltd., Hamilton, Ont. Very clear illustrations are given showing the principal constructional features of the locomotive, while the reading matter describes the details fully. There is also a table and two curve diagrams covering the mechanical performance of this type of locomotive of various capacities. The catalogue concludes with a number of specification sheets to be filled in by prospective customers.

The Canadian Domestic Engineering Co., Ltd., Montreal and Toronto, have sent us their latest catalogue on "Modern Methods of Heating, Ventilating, Sanitary and Electrical Design." The catalogue is divided into three parts, the first dealing with the organization and scope of the company, with reference to the advisability of employing a concern of this kind to carry out heating and ventilating work. The second and third parts contain brief descriptions of several installations designed by the company, also some very excellent illustrations.

George Swift & Sons, Halifax, Eng., have sent us a circular No. 30 descriptive of the line of machine tools which they manufacture. This includes, principally radial drills of various types and engine lathes which are illustrated clearly, and show distinctly the general design of the machines. Copies of this circular may be had by writing the company.

Book Reviews

The Bureau of Mines Branch, Department of the Interior, Washington, D. C., has published bulletin No. 60, entitled "Hydraulic Mine Filling." The bulletin is a report issued as one of a series, dealing with methods of increasing safety and efficiency in mining operations. It is a preliminary statement of present development in hydraulic mine filling in the anthracite region of Pennsylvania.

The Bureau of Mines, Department of the Interior, Washington, D.C., have published technical paper No. 66, entitled "Mud-laden Fluid Applied to Well Drilling." This bulletin deals with the use of mud-laden water when drilling for petroleum. The illustrations include views of different types of boreholes.

The Bureau of Mines, Department of the Interior, Washington, D.C., has published technical paper No. 58, entitled "The Action of Acid Mine Water on the Insulation of Electric Conductors." The bulletin contains reports of results obtained from the preliminary investigation into the effect of acids and moisture in mines on insulation, the purpose being to find out the best material to use for insulating purposes under those conditions. The results of tests made during the investigation are carefully tabulated and described.

"**R.M.S. Aquitania**" is the title of a very handsome and artistic brochure being distributed by the Cunard Steamship Co., Ltd., as a souvenir of the launching of their latest liner in April, 1913. The illustrations are exceedingly clear, and include views taken

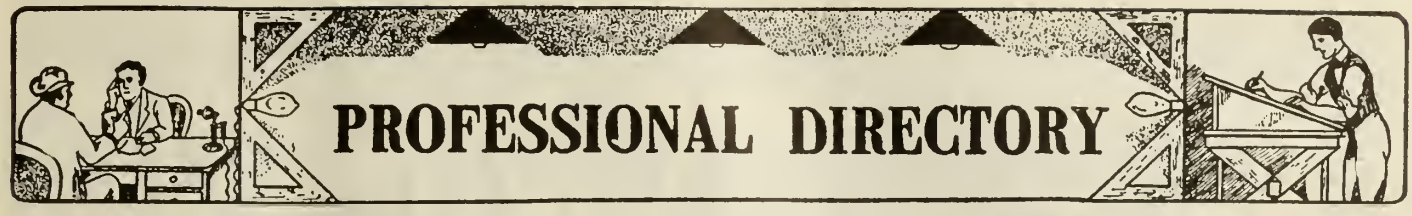
during various stages of construction from the laying of the keel to the launching of the vessel. The reading matter, which has been written by E. Veble Chatterton, gives much interesting information regarding the constructional features of the vessel.

Arithmetic of the Steam Boiler, by Charles J. Mason; 219 pages, 6¾ x 4¼ in.; illustrations, tables and diagrams, published by McGraw-Hill Book Co., New York. Price $1 net. This is the first edition of a work which has been included in the series of "Power Handbooks." It is a compilation of arithmetical rules and formulae, applicable to steam boilers of various types. The book deals with the application of arithmetic to steam boiler calculations, it being assumed that the reader is more or less familiar with the elements of arithmetic and understands the working of simple problems. The volume is divided into three parts. The first is sub-divided into chapters, the second is devoted to miscellaneous applications, while the third contains an appendix and a number of tables. The first chapter covers calculations on cylindrical vessels, as applied to boilers, also those for riveted joints. Boiler heads, stayed and unstayed, are dealt with in chapter 2, while chapter 3 is devoted to calculations for tubes, furnaces and boiler horse-power. In this chapter there is also an analysis of a boiler trial report. In part 2 a number of interesting calculations are given covering the strength of various parts, including formulae on safe working pressures. Part 3, or appendix, contains extracts from the rules of the United States Board of Supervising Inspectors, and from the rules of the State of Massachusetts for the design of boilers. The concluding pages contain mathematical tables, factors of evaporation, steam tables, etc. This will be found an exceedingly useful book for students and power plant engineers, and especially so for those who are preparing for examination for engineers' certificates. The author treats the subjet in a practical manner, and has carefully avoided complex calculations; as a result, readers will find no difficulty in applying the data contained in the book to the solution of problems arising during the performance of their duties.



A New Type of ENGINE
We claim the greatest improvement made in gasolene engines in many years.
The Sieverkropp
here shown is a 2-cycle, 1½ H.P. engine. Has the strength and durability of an expensive and cumbersome 4-cycle engine. Easy and economical to operate. Will run any machinery not requiring over 1½ H.P.
Agents wanted throughout Canada.
